ps2000aSetTriggerChannelDirections() - set up signal polarities for triggering ....... 96
ps2000aSetTriggerChannelProperties() - set up trigger thresholds ....................... 97
1 Introduction

1.1 Overview

The PicoScope 2000 Series PC Oscilloscopes from Pico Technology are high-speed real-time measuring instruments. They obtain their power from the USB port, so they do not need an additional power supply. With an arbitrary waveform generator these scopes contain everything you need in a convenient, portable unit.

This manual explains how to develop your own programs for collecting and analyzing data from the PicoScope 2000 Series oscilloscopes. It applies to all devices supported by the ps2000a application programming interface (API), as listed below:

<table>
<thead>
<tr>
<th>2-channel</th>
<th>2-channel MSO</th>
<th>4-channel</th>
</tr>
</thead>
<tbody>
<tr>
<td>PicoScope 2206</td>
<td>PicoScope 2205A MSO</td>
<td>PicoScope 2405A</td>
</tr>
<tr>
<td>PicoScope 2206A</td>
<td>PicoScope 2206B MSO</td>
<td>PicoScope 2406B</td>
</tr>
<tr>
<td>PicoScope 2206B</td>
<td>PicoScope 2207B MSO</td>
<td>PicoScope 2407B</td>
</tr>
<tr>
<td>PicoScope 2207</td>
<td>PicoScope 2208B MSO</td>
<td>PicoScope 2408B</td>
</tr>
<tr>
<td>PicoScope 2207A</td>
<td>PicoScope 2208</td>
<td>PicoScope 2205 MSO</td>
</tr>
<tr>
<td>PicoScope 2207B</td>
<td>PicoScope 2208A</td>
<td></td>
</tr>
<tr>
<td>PicoScope 2208</td>
<td>PicoScope 2208B</td>
<td></td>
</tr>
<tr>
<td>PicoScope 2208B</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Pico Software Development Kit (SDK) is available free of charge from www.picotech.com/downloads. This download includes support for all PicoScope oscilloscopes including the ps2000a API described in this manual, as well as the original ps2000 API for older oscilloscopes in the PicoScope 2000 Series.

SDK version: 10.6.10
1.2 PC requirements

To ensure that your PicoScope 2000 Series PC Oscilloscope operates correctly with the SDK, you must have a computer with at least the minimum system requirements to run one of the supported operating systems, as shown in the following table. The performance of the oscilloscope will be better with a more powerful PC, and will benefit from a multi-core processor.

<table>
<thead>
<tr>
<th>Item</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>Windows XP (SP3) or later (not Windows RT) 32-bit and 64-bit</td>
</tr>
<tr>
<td>Processor</td>
<td>As required by Windows</td>
</tr>
<tr>
<td>Memory</td>
<td></td>
</tr>
<tr>
<td>Free disk space</td>
<td></td>
</tr>
<tr>
<td>Ports*</td>
<td>USB 2.0 or USB 3.0 port</td>
</tr>
<tr>
<td></td>
<td>USB 1.1 port (absolute minimum)</td>
</tr>
</tbody>
</table>

* PicoScope oscilloscopes will operate slowly on a USB 1.1 port. Not recommended. USB 3.0 connections will run at about the same speed as USB 2.0.
1.3 Legal information

The material contained in this release is licensed, not sold. Pico Technology Limited grants a licence to the person who installs this software, subject to the conditions listed below.

Access. The licensee agrees to allow access to this software only to persons who have been informed of these conditions and agree to abide by them.

Usage. The software in this release is for use only with Pico products or with data collected using Pico products.

Copyright. Pico Technology Ltd. claims the copyright of, and retains the rights to, all material (software, documents, etc.) contained in this SDK except the example programs. You may copy and distribute the SDK without restriction, as long as you do not remove any Pico Technology copyright statements. The example programs in the SDK may be modified, copied and distributed for the purpose of developing programs to collect data using Pico products.

Liability. Pico Technology and its agents shall not be liable for any loss, damage or injury, howsoever caused, related to the use of Pico Technology equipment or software, unless excluded by statute.

Fitness for purpose. As no two applications are the same, Pico Technology cannot guarantee that its equipment or software is suitable for a given application. It is your responsibility, therefore, to ensure that the product is suitable for your application.

Mission-critical applications. This software is intended for use on a computer that may be running other software products. For this reason, one of the conditions of the licence is that it excludes use in mission-critical applications, for example life support systems.

Viruses. This software was continuously monitored for viruses during production, but you are responsible for virus-checking the software once it is installed.

Support. If you are dissatisfied with the performance of this software, please contact our technical support staff, who will try to fix the problem within a reasonable time. If you are still dissatisfied, please return the product and software to your supplier within 14 days of purchase for a full refund.

Upgrades. We provide upgrades, free of charge, from our web site at www.picotech.com. We reserve the right to charge for updates or replacements sent out on physical media.

Trademarks. Windows is a trademark or registered trademark of Microsoft Corporation. Pico Technology Limited and PicoScope are internationally registered trademarks.
2 Concepts

2.1 Driver

Your application will communicate with a PicoScope 2000 (A API) driver called ps2000a.dll, which is supplied in 32-bit and 64-bit versions. The driver exports the ps2000a function definitions in standard C format, but this does not limit you to programming in C. You can use the API with any programming language that supports standard C calls.

The API driver depends on another DLL, picoipp.dll (which is supplied in 32-bit and 64-bit versions) and a low-level driver called WinUsb.sys. These are installed by the SDK and configured when you plug the oscilloscope into each USB port for the first time. Your application does not call these drivers directly.

2.2 System requirements

General requirements
See PC requirements.

USB
The ps2000a driver offers four different sampling modes (methods of recording data) all of which support USB 1.1, USB 2.0 and USB 3.0. The fastest transfer rates are achieved using USB 2.0 or USB 3.0.

Note: USB 3.0 connections will run at about the same speed as USB 2.0.

2.3 General procedure

A typical program for capturing data consists of the following steps:

1. Open the scope unit.
2. Set up the input channels with the required voltage ranges and coupling type.
3. Set up triggering.
4. Start capturing data. (See Sampling modes, where programming is discussed in more detail.)
5. Wait until the scope unit is ready.
6. Stop capturing data.
7. Copy data to a buffer.
8. Close the scope unit.

Many sample programs are included in the SDK. These demonstrate how to use the functions of the driver software in each of the modes available.
2.4 Voltage ranges

Analog input channels
You can set a device input channel to any voltage range from ±20 mV to ±20 V (subject to the device specification) with `ps2000aSetChannel`. Each sample is scaled to 16 bits, and the minimum and maximum values returned to your application are given by `ps2000aMinimumValue` and `ps2000aMaximumValue` as follows:

<table>
<thead>
<tr>
<th>Function</th>
<th>Voltage</th>
<th>Value returned</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>decimal</td>
</tr>
<tr>
<td><code>ps2000aMaximumValue</code></td>
<td>maximum</td>
<td>32 512</td>
</tr>
<tr>
<td></td>
<td>zero</td>
<td>0</td>
</tr>
<tr>
<td><code>ps2000aMinimumValue</code></td>
<td>minimum</td>
<td>–32 512</td>
</tr>
</tbody>
</table>

Example
1. Call `ps2000aSetChannel` with range set to `PS2000A_1V`.
2. Apply a sine wave input of 500 mV amplitude to the oscilloscope.
3. Capture some data using the desired sampling mode.
4. The data will be encoded as shown opposite.

External trigger input (PicoScope 2206, 2207 and 2208 only)
The external trigger input (marked EXT), where available, is scaled to a 16-bit value as follows:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Constant</th>
<th>Digital value</th>
</tr>
</thead>
<tbody>
<tr>
<td>–5 V</td>
<td><code>PS2000A_EXT_MIN_VALUE</code></td>
<td>–32 767</td>
</tr>
<tr>
<td>0 V</td>
<td></td>
<td>0</td>
</tr>
<tr>
<td>+5 V</td>
<td><code>PS2000A_EXT_MAX_VALUE</code></td>
<td>+32 767</td>
</tr>
</tbody>
</table>
2.5 MSO digital data

This section applies to mixed-signal oscilloscopes (MSOs) only

A PicoScope MSO has two 8-bit digital ports—PORT0 and PORT1—making a total of 16 digital channels.

The data from each port is returned in a separate buffer that is set up by the `ps2000aSetDataBuffer` and `ps2000aSetDataBuffers` functions. For compatibility with the analog channels, each buffer is an array of 16-bit words. The 8-bit port data occupies the lower 8 bits of the word, and the upper 8 bits of the word are undefined.

### PORT1 buffer

<table>
<thead>
<tr>
<th>Sample₀</th>
<th>[XXXXXXXX,D15...D8]₀</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>Sampleₙ₋₁</td>
<td>[XXXXXXXX,D15...D8]ₙ₋₁</td>
</tr>
</tbody>
</table>

### PORT0 buffer

<table>
<thead>
<tr>
<th>PORT0 buffer</th>
</tr>
</thead>
<tbody>
<tr>
<td>[XXXXXXXX,D7...D0]₀</td>
</tr>
<tr>
<td>...</td>
</tr>
<tr>
<td>[XXXXXXXX,D7...D0]ₙ₋₁</td>
</tr>
</tbody>
</table>

Retrieving stored digital data

The following C code snippet shows how to combine data from the two 8-bit ports into a single 16-bit word and then extract individual bits from the 16-bit word.

```c
// Mask Port 1 values to get lower 8 bits
portValue = 0x00ff & appDigiBuffers[2][i];

// Shift by 8 bits to place in upper 8 bits of 16-bit word
portValue <<= 8;

// Mask Port 0 values to get lower 8 bits and apply bitwise
// inclusive OR to combine with Port 1 values
portValue |= 0x00ff & appDigiBuffers[0][i];

for (bit = 0; bit < 16; bit++)
{
  // Shift value (32768 - binary 1000 0000 0000 0000),
  // AND with value to get 1 or 0 for channel.
  // Order will be D15 to D8, then D7 to D0.

  bitValue = (0x8000 >> bit) & portValue? 1 : 0;
}
```
2.6 Triggering

PicoScope oscilloscopes can either start collecting data immediately or be programmed to wait for a trigger event. In both cases you need to use the trigger functions:

- `ps2000aSetTriggerChannelConditions`
- `ps2000aSetTriggerChannelDirections`
- `ps2000aSetTriggerChannelProperties`

Alternatively you can call `ps2000aSetSimpleTrigger`, which in turn calls all three of the above functions and allows you to set up triggers more quickly in simple cases.

A trigger event can occur when one of the signal or trigger input channels crosses a threshold voltage on either a rising or a falling edge. It is also possible to combine two inputs using the logic trigger function.

To set up pulse width, delay and dropout triggers, you can also call the pulse width qualifier function:

- `ps2000aSetPulseWidthQualifier`
2.7 Sampling modes

PicoScope 2000 Series oscilloscopes can run in various sampling modes.

- **Block mode.** In this mode, the scope stores data in internal buffer memory and then transfers it to the PC. When the data has been collected it is possible to examine the data, with an optional downsampling factor. The data is lost when a new run is started in the same segment, the settings are changed, or the scope is powered down.

- **ETS mode.** In this mode, it is possible to increase the effective sampling rate of the scope when capturing repetitive signals. It is a modified form of block mode.

- **Rapid block mode.** This is a variant of block mode that allows you to capture more than one waveform at a time with a minimum of delay between captures. You can use downsampling in this mode if you wish.

- **Streaming mode.** In this mode, data is passed directly to the PC without being stored in the scope’s internal buffer memory. This enables long periods of data collection for chart recorder and data-logging applications. Streaming mode supports downsampling and triggering, while providing fast streaming at typical rates of 1 to 10 MS/s, as specified in the data sheet for your device.

In all sampling modes, the driver returns data asynchronously using a callback. This is a call to one of the functions in your own application. When you request data from the scope, you pass to the driver a pointer to your callback function. When the driver has written the data to your buffer, it makes a callback (calls your function) to signal that the data is ready. The callback function then signals to the application that the data is available.

Because the callback is called asynchronously from the rest of your application, in a separate thread, you must ensure that it does not corrupt any global variables while it runs.

For compatibility with programming environments not supporting C-style callback functions, polling of the driver is available in block mode.
2.7.1 Block mode

In block mode, the computer prompts a PicoScope 2000 Series oscilloscope to collect a block of data into its internal memory. When the oscilloscope has collected the whole block, it signals that it is ready and then transfers the whole block to the computer's memory through the USB port.

- **Block size.** The maximum number of values depends upon the size of the oscilloscope's memory. The memory buffer is shared between the enabled channels, so if two channels are enabled, each receives half the memory, and if four channels are enabled, each receives a quarter of the memory. These features are handled transparently by the driver. The block size also depends on the number of memory segments in use (see `ps2000aMemorySegments`).

* The PicoScope MSO models behave differently. If only the two analog channels or only the two digital ports are enabled, each receives half the memory. If any combination of one or two analog channels and one or two digital ports is enabled, each receives a quarter of the memory.

- **Sampling rate.** A PicoScope 2000 Series oscilloscope can sample at a number of different rates according to the selected timebase and the combination of channels that are enabled. See the Timebases section for the specifications that apply to your scope model.

- **Setup time.** The driver normally performs a number of setup operations, which can take up to 50 milliseconds, before collecting each block of data. If you need to collect data with the minimum time interval between blocks, use rapid block mode and avoid calling setup functions between calls to `ps2000aRunBlock`, `ps2000aStop` and `ps2000aGetValues`.

- **Downsampling.** When the data has been collected, you can set an optional downsampling factor and examine the data. Downsampling is a process that reduces the amount of data by combining adjacent samples. It is useful for zooming in and out of the data without having to repeatedly transfer the entire contents of the scope's buffer to the PC.

- **Memory segmentation.** The scope's internal memory can be divided into segments so that you can capture several waveforms in succession. Configure this using `ps2000aMemorySegments`.

- **Data retention.** The data is lost when a new run is started in the same segment, the settings are changed, or the scope is powered down.

See Using block mode for programming details.
2.7.1.1 Using block mode

This is the general procedure for reading and displaying data in block mode using a single memory segment:

Note: Use the * steps when using the digital ports on MSO models.

1. Open the oscilloscope using `ps2000aOpenUnit`.
2. Select channel ranges and AC/DC coupling using `ps2000aSetChannel`.
2*. Set the digital port using `ps2000aSetDigitalPort`.
3. Using `ps2000aGetTimebase`, select timebases until the required nanoseconds per sample is located.
4. Use the trigger setup functions `ps2000aSetTriggerChannelConditions`, `ps2000aSetTriggerChannelDirections` and `ps2000aSetTriggerChannelProperties` to set up the trigger if required.
4*. Use the trigger setup functions `ps2000aSetTriggerDigitalPortProperties` to set up the digital trigger if required.
5. Start the oscilloscope running using `ps2000aRunBlock`.
6. Wait until the oscilloscope is ready using the `ps2000aBlockReady` callback (or poll using `ps2000aIsReady`).
7. Use `ps2000aSetDataBuffer` to tell the driver where your memory buffer is. (For greater efficiency when doing multiple captures, you can call this function outside the loop, after step 4.)
8. Transfer the block of data from the oscilloscope using `ps2000aGetValues`.
9. Display the data.
10. Stop the oscilloscope using `ps2000aStop`.
11. Repeat steps 5 to 9.
12. Request new views of stored data using different downsampling parameters. See Retrieving stored data.
13. Call `ps2000aCloseUnit`.

2.7.1.2 Asynchronous calls in block mode

To avoid blocking the calling thread when calling `ps2000aGetValues`, it is possible to call `ps2000aGetValuesAsync` instead. This immediately returns control to the calling thread, which then has the option of waiting for the data or calling `ps2000aStop` to abort the operation.
2.7.2 Rapid block mode

In normal block mode, the PicoScope 2000 Series scopes collect one waveform at a time. You start the device running, wait until all samples are collected by the device, and then download the data to the PC or start another run. There is a time overhead of tens of milliseconds associated with starting a run, causing a gap between waveforms. When you collect data from the device, there is another minimum time overhead which is most noticeable when using a small number of samples.

Rapid block mode allows you to sample several waveforms at a time with the minimum time between waveforms. It reduces the gap from milliseconds to less than 2 microseconds (on the fastest timebase). Each waveform is stored in a separate buffer segment.

2.7.2.1 Using rapid block mode

You can use rapid block mode with or without aggregation. With aggregation, you need to set up two buffers per channel to receive the minimum and maximum values.

Note: Use the * steps when using the digital ports on the mixed-signal (MSO) models.

Without aggregation

1. Open the oscilloscope using `ps2000aOpenUnit`.
2. Select channel ranges and AC/DC coupling using `ps2000aSetChannel`.
3. [MSOs only] Set the digital port using `ps2000aSetDigitalPort`.
4. Set the number of memory segments equal to or greater than the number of captures required using `ps2000aMemorySegments`. Use `ps2000aSetNoOfCaptures` before each run to specify the number of waveforms to capture.
5. Using `ps2000aGetTimebase`, select timebases from zero upwards until the required number of nanoseconds per sample is located.
6. Use the trigger setup functions `ps2000aSetTriggerChannelConditions`, `ps2000aSetTriggerChannelDirections` and `ps2000aSetTriggerChannelProperties` to set up the trigger if required.
7. [MSOs only] Use the trigger setup functions `ps2000aSetTriggerDigitalPortProperties` to set up the digital trigger if required.
8. Start the oscilloscope running using `ps2000aRunBlock`.
9. Wait until the oscilloscope is ready using the `ps2000aIsReady` or wait on the callback function.
10. Use `ps2000aSetDataBuffer` to tell the driver where your memory buffers are. Call the function once for each channel/segment combination for which you require data. For greater efficiency, these calls can be made outside the loop, between steps 7 and 8.
11. Transfer the blocks of data from the oscilloscope using `ps2000aGetValuesBulk`.
12. Retrieve the time offset for each data segment using `ps2000aGetValuesTriggerTimeOffsetBulk64`.
13. Display the data.
14. Repeat steps 8 to 13 if you wish to capture more data.
15. Stop the oscilloscope using `ps2000aStop`.
16. Call `ps2000aCloseUnit`.

With aggregation

To use rapid block mode with aggregation, follow steps 1 to 9 above and then:

10a. Call `ps2000aSetDataBuffer` or (`ps2000aSetDataBuffers`) to set up one pair of buffers for every waveform segment required.
11a. Call `ps2000aGetValuesBulk` for each pair of buffers.
12a. Retrieve the time offset for each data segment using `ps2000aGetValuesTriggerTimeOffsetBulk64`.

Continue from step 13.
2.7.2.2 Rapid block mode example 1: no aggregation

#define MAX_SAMPLES 1000

Set up the device up as usual.

- Open the device
- Channels
- Trigger
- Number of memory segments (this should be equal or more than the no of captures required)

    // set the number of waveforms to 32
    ps2000aSetNoOfCaptures (handle, 32);

    pParameter = false;
    ps2000aRunBlock
    {
        handle,
        0,       // noOfPreTriggerSamples
        MAX_SAMPLES,  // noOfPostTriggerSamples
        1,       // timebase to be used
        1,
        &timeIndisposedMs,
        0,       // segment index
        lpReady,
        &pParameter
    };

Comment: these variables have been set as an example and can be any valid value. pParameter will be set true by your callback function lpReady.

    while (!pParameter) Sleep (0);

    for (int i = 0; i < 10; i++)
    {
        for (int c = PS2000A_CHANNEL_A; c <= PS2000A_CHANNEL_B; c++)
        {
            ps2000aSetDataBuffer
            {
                handle,
                c,
                &buffer[c][i],
                MAX_SAMPLES,
                i,
                PS2000A_RATIO_MODE_NONE
            };
        }
    }

Comments: buffer has been created as a two-dimensional array of pointers to int16_t, which will contain 1000 samples as defined by MAX_SAMPLES. There are only 10 buffers set, but it is possible to set up to the number of captures you have requested.
ps2000aGetValuesBulk
(
    handle,
    &noOfSamples,       // set to MAX_SAMPLES on entering the function
    10,                 // fromSegmentIndex
    19,                 // toSegmentIndex
    PS2000A_RATIO_MODE_NONE, // downsampling ratio mode
    overflow           // an array of size 10 int16_t
)

Comments: See the earlier snippets for code to set up the segment buffers.

The number of samples could be up to noOfPreTriggerSamples + noOfPostTriggerSamples, the values set in ps2000aRunBlock. The samples are always returned from the first sample taken, unlike the ps2000aGetValues function which allows the sample index to be set. The above segments start at 10 and finish at 19 inclusive. It is possible for the fromSegmentIndex to wrap around to the toSegmentIndex, by setting the fromSegmentIndex to 28 and the toSegmentIndex to 7.

ps2000aGetValuesTriggerTimeOffsetBulk64
(
    handle,            
    times,            
    timeUnits,        
    10,              
    19                
)

Comments: the above segments start at 10 and finish at 19 inclusive. It is possible for the fromSegmentIndex to wrap around to the toSegmentIndex, if the fromSegmentIndex is set to 28 and the toSegmentIndex to 7.
2.7.2.3 Rapid block mode example 2: using aggregation

#define MAX_SAMPLES 1000

Set up the device up as usual.

- Open the device
- Channels
- Trigger
- Number of memory segments (this should be equal or more than the number of captures required)

    // set the number of waveforms to 32
    ps2000aSetNoOfCaptures(handle, 32);

    pParameter = false;
    ps2000aRunBlock
    (handle,
     0,  // noOfPreTriggerSamples,
     MAX_SAMPLES,  // noOfPostTriggerSamples,
     1,  // timebase to be used,
     1,
     &timeIndisposedMs,
     1,  // SegmentIndex
     lpReady,
     &pParameter
     );

Comments: the set-up for running the device is exactly the same whether or not aggregation will be used when you retrieve the samples.

    for (int segment = 10; segment < 20; segment++)
    {
        for (int c = PS2000A_CHANNEL_A; c <= PS2000A_CHANNEL_D; c++)
        {
            ps2000aSetDataBuffers
            (handle,
             c,  //bufferMax[c],
             &bufferMax[c],
             MAX_SAMPLES
             segment,
             PS2000A_RATIO_MODE_AGGREGATE
             );
        }
    }

Comments: since only one waveform will be retrieved at a time, you only need to set up one pair of buffers; one for the maximum samples and one for the minimum samples. Again, the buffer sizes are 1000 (MAX_SAMPLES) samples.

    ps2000aGetValues
(  handle,  
0,  
&noOfSamples,  // set to MAX_SAMPLES on entering  
10,  
&downSampleRatioMode, //set to RATIO_MODE_AGGREGATE  
index,  
overflow  
);  

ps2000aGetTriggerTimeOffset64  
(  handle,  
&time,  
&timeUnits,  
index  
)  

Comments: each waveform is retrieved one at a time from the driver with an aggregation of 10.
2.7.3 ETS (Equivalent Time Sampling)

ETS is a way of increasing the effective sampling rate of the scope when capturing repetitive signals. It is a modified form of block mode, and is controlled by the ps2000a set of trigger functions and the ps2000aSetEts function.

Overview. ETS works by capturing several cycles of a repetitive waveform, then combining them to produce a composite waveform that has a higher effective sampling rate than the individual captures. The scope hardware accurately measures the delay, which is a small fraction of a single sampling interval, between each trigger event and the subsequent sample. The driver then shifts each capture slightly in time and overlays them so that the trigger points are exactly lined up. The result is a larger set of samples spaced by a small fraction of the original sampling interval. The maximum effective sampling rates that can be achieved with this method are listed in the User’s Guide for the scope device. Other scopes do not contain special ETS hardware, so the composite waveform is created by software.

Trigger stability. Because of the high sensitivity of ETS mode to small time differences, the trigger must be set up to provide a stable waveform that varies as little as possible from one capture to the next.

Callback. ETS mode calls the ps2000aBlockReady callback function when a new waveform is ready for collection. The ps2000aGetValues function needs to be called for the waveform to be retrieved.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Available in block mode only.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Not suitable for one-shot (non-repetitive) signals.</td>
</tr>
<tr>
<td></td>
<td>Aggregation is not supported.</td>

</tr>
<tr>
<td></td>
<td>Cannot be used when MSO digital ports are enabled.</td>
</tr>
</tbody>
</table>
2.7.3.1 Using ETS mode

This is the general procedure for reading and displaying data in ETS mode using a single memory segment:

1. Open the oscilloscope using `ps2000aOpenUnit`.
2. Select channel ranges and AC/DC coupling using `ps2000aSetChannel`.
3. Use `ps2000aSetEts` to enable ETS and set the parameters.
4. Use the trigger setup functions `ps2000aSetTriggerChannelConditions`, `ps2000aSetTriggerChannelDirections` and `ps2000aSetTriggerChannelProperties` to set up the trigger if required.
5. Start the oscilloscope running using `ps2000aRunBlock`.
6. Wait until the oscilloscope is ready using the `ps2000aBlockReady` callback (or poll using `ps2000aIsReady`).
7. Use `ps2000aSetDataBuffer` to tell the driver where to store sampled data.
8. Use `ps2000sSetEtsTimeBuffer` or `ps2000sSetEtsTimeBuffers` to tell the driver where to store sample times.
9. Transfer the block of data from the oscilloscope using `ps2000aGetValues`.
10. Display the data.
11. While you want to collect updated captures, repeat steps 7 to 10.
12. Stop the oscilloscope using `ps2000aStop`.
13. Repeat steps 5 to 12.
14. Call `ps2000aCloseUnit`.
2.7.4 Streaming mode

Streaming mode, unlike block mode, can capture data without gaps between blocks. Streaming mode supports downsampling and triggering, while providing fast streaming. This makes it suitable for high-speed data acquisition, allowing you to capture long data sets limited only by the computer's memory.

- **Aggregation.** The driver returns aggregated readings while the device is streaming. If aggregation is set to 1, only one buffer is used per channel. When aggregation is set above 1, two buffers (maximum and minimum) per channel are used.

- **Memory segmentation.** The memory can be divided into segments to reduce the latency of data transfers to the PC. However, this increases the risk of losing data if the PC cannot keep up with the device's sampling rate.

See Using streaming mode for programming details.
2.7.4.1 Using streaming mode

This is the general procedure for reading and displaying data in streaming mode using a single memory segment:

**Note**: Please use the * steps when using the digital ports on the mixed-signal (MSO) models.

1. Open the oscilloscope using `ps2000aOpenUnit`.
2. Select channels, ranges and AC/DC coupling using `ps2000aSetChannel`.
4. Use the trigger setup functions `ps2000aSetTriggerChannelConditions`, `ps2000aSetTriggerChannelDirections` and `ps2000aSetTriggerChannelProperties` to set up the trigger if required.
5. Use the trigger setup functions `ps2000aSetTriggerDigitalPortProperties` to set up the digital trigger if required.
6. Call `ps2000aSetDataBuffer` (or `ps2000aSetDataBuffers` if you will be using aggregation) to tell the driver where your data buffer is.
7. Start the oscilloscope running using `ps2000aRunStreaming`.
8. Call `ps2000aGetStreamingLatestValues` to get data.
9. Process data returned to your application's function. This example is using autoStop, so after the driver has received all the data points requested by the application, it stops the device streaming.
10. Call `ps2000aCloseUnit`.

**Diagram**:

</table>
```
2.7.5 Retrieving stored data

You can collect data from the `ps2000a` driver with a different downsampling factor when `ps2000aRunBlock` or `ps2000aRunStreaming` has already been called and has successfully captured all the data. Use `ps2000aGetValuesAsync`.
2.8 Timebases

The ps2000a API allows you to select any of $2^{32}$ different timebases based on the maximum sampling rate of your oscilloscope. The timebases allow slow enough sampling in block mode to overlap the streaming sample intervals, so that you can make a smooth transition between block mode and streaming mode. Calculate the timebase using the \texttt{ps2000aGetTimebase} call.

500 MS/s maximum sampling rate models:

<table>
<thead>
<tr>
<th>timebase (n)</th>
<th>sample interval formula</th>
<th>sample interval examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>$2^n / 500,000,000$</td>
<td>2 ns*</td>
</tr>
<tr>
<td>1</td>
<td>$4^n$</td>
<td>4 ns</td>
</tr>
<tr>
<td>2</td>
<td>$8^n$</td>
<td>8 ns</td>
</tr>
</tbody>
</table>
| 3 to $2^{32}-1$ | $(n - 2) / 62,500,000$ | 3 => 16 ns ...
|               |                        | $2^{32}-1 => \sim 69$ s |

|               |                        | $2^{32}-1 => \sim 34$ s |

PicoScope 2205 MSO:

<table>
<thead>
<tr>
<th>timebase (n)</th>
<th>sample interval formula</th>
<th>sample interval examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>$2^n / 200,000,000$</td>
<td>0 =&gt; 5 ns**</td>
</tr>
<tr>
<td>1</td>
<td>$n / 100,000,000$</td>
<td>10 ns</td>
</tr>
<tr>
<td>2</td>
<td>$20^n$</td>
<td>20 ns</td>
</tr>
</tbody>
</table>
| 3 to $2^{32}-1$ | $30^n$                | 3 => 30 ns...
|               |                        | $2^{32}-1 => \sim 43$ s |

† The fastest available sampling rate may depend on which channels are enabled, and on the sampling mode. Refer to the oscilloscope data sheet for sampling rate specifications. In streaming mode the sampling rate may additionally be limited by the speed of the USB port.

* Available only in single-channel mode.

** Not available when channel B active, nor when channel A and both digital ports active.

ETS mode

In ETS mode the sample time is not set according to the above tables but is instead calculated and returned by \texttt{ps2000aSetEts}.
2.9 MSO digital connector diagram

The MSO models have a digital input connector. The layout of the 20-pin header plug is detailed below. The diagram is drawn as you look at the front panel of the device.

![MSO digital connector diagram]

2.10 Combining several oscilloscopes

It is possible to collect data using up to 64 PicoScope 2000 Series oscilloscopes at the same time, subject to the capabilities of the PC. Each oscilloscope must be connected to a separate USB port. The ps2000aOpenUnit function returns a handle to an oscilloscope. All the other functions require this handle for oscilloscope identification. For example, to collect data from two oscilloscopes at the same time:

```c
CALLBACK ps2000aBlockReady(...) // define callback function specific to application

handle1 = ps2000aOpenUnit()
handle2 = ps2000aOpenUnit()

ps2000aSetChannel(handle1) // set up unit 1
ps2000aSetDigitalPort(handle1) // only when using MSO
ps2000aRunBlock(handle1)

ps2000aSetChannel(handle2) // set up unit 2
ps2000aSetDigitalPort(handle2) // only when using MSO
ps2000aRunBlock(handle2)

// data will be stored in buffers
// and application will be notified using callback

ready = FALSE
while not ready
    ready = handle1_ready
    ready &= handle2_ready
```
3 API functions

The ps2000a API exports a number of functions for you to use in your own applications. All functions are C functions using the standard call naming convention (__stdcall). They are all exported with both decorated and undecorated names.
3.1 ps2000aBlockReady() - find out if block-mode data ready

typedef void (CALLBACK *ps2000aBlockReady)
(
    int16_t handle,
    PICO_STATUS status,
    void * pParameter
)

This callback function is part of your application. You register it with the ps2000a driver using ps2000aRunBlock, and the driver calls it back when block-mode data is ready. You can then download the data using the ps2000aGetValues function.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Block mode only</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by ps2000aOpenUnit status, indicates whether an error occurred during collection of the data * pParameter, a void pointer passed from ps2000aRunBlock. Your callback function can write to this location to send any data, such as a status flag, back to your application.</td>
</tr>
<tr>
<td>Returns</td>
<td>nothing</td>
</tr>
</tbody>
</table>
3.2 ps2000aCloseUnit() - close a scope device

```c
PICO_STATUS ps2000aCloseUnit
(int16_t handle)
```

This function shuts down an oscilloscope.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by ps2000aOpenUnit</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK, PICO_HANDLE_INVALID, PICO_USER_CALLBACK, PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>
3.3 ps2000aDataReady() - find out if post-collection data ready

```c
typedef void (__stdcall *ps2000aDataReady)(
    int16_t handle,
    PICO_STATUS status,
    uint32_t noOfSamples,
    int16_t overflow,
    void * pParameter
);
```

This is a callback function that you write to collect data from the driver. You supply a pointer to the function when you call `ps2000aGetValuesAsync`, and the driver calls your function back when the data is ready.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>status, a <code>PICO_STATUS</code> code returned by the driver</td>
</tr>
<tr>
<td></td>
<td>noOfSamples, the number of samples collected</td>
</tr>
<tr>
<td></td>
<td>overflow, a set of flags that indicates whether an overvoltage has occurred and on which channels. It is a bit field with bit 0 representing Channel A.</td>
</tr>
<tr>
<td></td>
<td>* pParameter, a void pointer passed from <code>ps2000aGetValuesAsync</code>. The callback function can write to this location to send any data, such as a status flag, back to the application. The data type is defined by the application programmer.</td>
</tr>
<tr>
<td>Returns</td>
<td>nothing</td>
</tr>
</tbody>
</table>
3.4 ps2000aEnumerateUnits() - find all connected oscilloscopes

This function counts the number of unopened PicoScope 2000 Series (A API) units connected to the computer and returns a list of serial numbers as a string. It does not detect units that are already open and have a handle assigned to them by the driver.

```c
PICO_STATUS ps2000aEnumerateUnits
(
    int16_t * count,
    int8_t * serials,
    int16_t * serialLth
)
```

**Arguments**

- `* count`, on exit, the number of ps2000a units found
- `* serials`, on exit, a list of serial numbers separated by commas and terminated by a final null
  
  Example: AQ005/139,VDR61/356,ZOR14/107
  
  Can be NULL on entry if serial numbers are not required
- `* serialLth`, on entry, the length of the char buffer pointed to by `serials`; on exit, the length of the string written to `serials`

**Returns**

- PICO_OK
- PICO_BUSY
- PICO_NULL_PARAMETER
- PICO_FW_FAIL
- PICO_CONFIG_FAIL
- PICO_MEMORY_FAIL
- PICO_CONFIG_FAIL_AWG
- PICO_INITIALISE_FPGA
3.5 ps2000aFlashLed() - flash the front-panel LED

```c
PICO_STATUS ps2000aFlashLed
(
    int16_t     handle,
    int16_t     start
)
```

This function flashes the LED on the front of the scope without blocking the calling thread. Calls to `ps2000aRunStreaming` and `ps2000aRunBlock` cancel any flashing started by this function. It is not possible to set the LED to be constantly illuminated, as this state is used to indicate that the scope has not been initialized.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| Arguments          | handle, device identifier returned by `ps2000aOpenUnit`  
  start, the action required:  
  
  | < 0  
  | 0   
  | > 0  |

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>PICO_OK</td>
</tr>
<tr>
<td>PICO_HANDLE_INVALID</td>
</tr>
<tr>
<td>PICO_BUSY</td>
</tr>
<tr>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
<tr>
<td>PICO_NOT RESPONDING</td>
</tr>
</tbody>
</table>
3.6 ps2000aGetAnalogueOffset() - get allowable offset range

```c
PICO_STATUS ps2000aGetAnalogueOffset
(
    int16_t handle,
    PS2000A_RANGE range,
    PS2000A_COUPLING coupling
    float * maximumVoltage,
    float * minimumVoltage
)
```

This function is used to get the maximum and minimum allowable analog offset for a specific voltage range.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All ps2000a units except the PicoScope 2205 MSO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>range, the voltage range to be used when gathering the min and max information</td>
</tr>
<tr>
<td></td>
<td>coupling, the type of AC/DC coupling used</td>
</tr>
<tr>
<td></td>
<td>* <code>maximumVoltage</code>, output: maximum voltage allowed for the range. Pointer will be ignored if NULL. If device does not support analog offset, zero will be returned.</td>
</tr>
<tr>
<td></td>
<td>* <code>minimumVoltage</code>, output: minimum voltage allowed for the range. Pointer will be ignored if NULL. If device does not support analog offset, zero will be returned.</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_VOLTAGE_RANGE</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER</td>
</tr>
</tbody>
</table>

If both `maximumVoltage` and `minimumVoltage` are NULL, the driver will return PICO_NULL_PARAMETER.
3.7 ps2000aGetChannelInformation() - get list of available ranges

```c
PICO_STATUS ps2000aGetChannelInformation
(`
  int16_t handle,
  PS2000A_CHANNEL_INFO info
  int32_t probe
  int32_t * ranges
  int32_t * length
  int32_t channels
`)
```

This function queries which ranges are available on a scope device.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by ps2000aOpenUnit info, the type of information required. The following value is currently supported: PS2000A_CI_RANGES probe, not used, must be set to 0 * ranges, an array that will be populated with available PS2000A_RANGE values for the given info. If NULL, length is set to the number of ranges available. * length, input: length of ranges array; output: number of elements written to ranges array channels, the channel for which the information is required</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_HANDLE_INVALID</td>
</tr>
<tr>
<td></td>
<td>PICO_BUSY</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
<tr>
<td></td>
<td>PICO_NOT_RESPONDING</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_CHANNEL</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_INFO</td>
</tr>
</tbody>
</table>

3.8 ps2000aGetMaxDownSampleRatio() - get aggregation ratio for data

```c
PICO_STATUS ps2000aGetMaxDownSampleRatio(
    int16_t handle,
    uint32_t noOfUnaggregatedSamples,
    uint32_t * maxDownSampleRatio,
    PS2000A_RATIO_MODE downSampleRatioMode,
    uint32_t segmentIndex
)
```

This function returns the maximum downsampling ratio that can be used for a given number of samples in a given downsampling mode.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by ps2000aOpenUnit</td>
</tr>
<tr>
<td></td>
<td>noOfUnaggregatedSamples, the number of unprocessed samples to be downsampled</td>
</tr>
<tr>
<td></td>
<td>* maxDownSampleRatio, the maximum possible downsampling ratio output</td>
</tr>
<tr>
<td></td>
<td>downSampleRatioMode, the downsampling mode. See ps2000aGetValues.</td>
</tr>
<tr>
<td></td>
<td>segmentIndex, the memory segment where the data is stored</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_NO_SAMPLES_AVAILABLE</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_PARAMETER</td>
</tr>
<tr>
<td></td>
<td>PICO_SEGMENT_OUT_OF_RANGE</td>
</tr>
<tr>
<td></td>
<td>PICO_TOO_MANY_SAMPLES</td>
</tr>
</tbody>
</table>

3.9 ps2000aGetMaxSegments() - find out how many segments allowed

```c
PICO_STATUS ps2000aGetMaxSegments
(
    int16_t handle,
    uint32_t * maxsegments
)
```

This function returns the maximum number of segments allowed for the opened variant. Refer to `ps2000aMemorySegments` for specific figures.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| **Arguments**       | handle, device identifier returned by `ps2000aOpenUnit`
|                     | * maxsegments, output: maximum number of segments allowed |
| **Returns**         | PICO_OK
|                     | PICO_INVALID_HANDLE
|                     | PICO_DRIVER_FUNCTION
|                     | PICO_NULL_PARAMETER |
3.10 ps2000aGetNoOfCaptures() - get number of captures available

```c
PICO_STATUS ps2000aGetNoOfCaptures
(
    int16_t handle,
    uint32_t * nCaptures
)
```

This function finds out how many captures are available in rapid block mode after `ps2000aRunBlock` has been called. It can be called during data capture, or after the normal end of collection, or after data collection was terminated by `ps2000aStop`. The returned value (`* nCaptures`) can then be used to iterate through the number of segments using `ps2000aGetValues`, or in a single call to `ps2000aGetValuesBulk` where it is used to calculate the `toSegmentIndex` parameter.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Rapid block mode</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by `ps2000aOpenUnit`
|               | * nCaptures, output: the number of available captures that has been collected from calling `ps2000aRunBlock` |
| Returns       | PICO_OK
|               | PICO_DRIVER_FUNCTION
|               | PICO_INVALID_HANDLE

3.11 ps2000aGetNoOfProcessedCaptures() - get number of captures processed

PICO_STATUS ps2000aGetNoOfProcessedCaptures
  (
    int16_t handle,
    uint32_t * nCaptures
  )

This function finds out how many captures in rapid block mode have been processed after `ps2000aRunBlock` has been called and the collection is either still in progress, completed, or interrupted by a call to `ps2000aStop`.

It is mainly intended for use while capture is still in progress and you are collecting data using `ps2000aGetValuesOverlappedBulk`. The returned value (`* nCaptures`) indicates how many captures have been completed and therefore how many buffer segments have been filled.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Rapid block mode</th>
</tr>
</thead>
</table>
| Arguments             | handle, device identifier returned by `ps2000aOpenUnit`
|                       | * nCaptures, output: the number of available captures resulting from the call to `ps2000aRunBlock` |
| Returns               | PICO_OK           |
|                       | PICO_DRIVER_FUNCTION |
|                       | PICO_INVALID_HANDLE |
|                       | PICO_NO_SAMPLES_AVAILABLE |
|                       | PICO_NULL_PARAMETER |
|                       | PICO_INVALID_PARAMETER |
|                       | PICO_SEGMENT_OUT_OF_RANGE |
|                       | PICO_TOO_MANY_SAMPLES |
3.12 ps2000aGetStreamingLatestValues() - get streaming data while scope is running

```c
PICO_STATUS ps2000aGetStreamingLatestValues
(
    int16_t handle,
    ps2000aStreamingReady lpPs2000AReady,
    void * pParameter
)
```

This function instructs the driver to return the next block of values to your `ps2000aStreamingReady` callback function. You must have previously called `ps2000aRunStreaming` beforehand to set up streaming.

### Applicability
- **Streaming** mode only

### Arguments
- `handle`, device identifier returned by `ps2000aOpenUnit`
- `lpPs2000AReady`, a pointer to your `ps2000aStreamingReady` callback function
- `* pParameter`, a void pointer that will be passed to the `ps2000aStreamingReady` callback function. The callback function may optionally use this pointer to return information to the application.

### Returns
- `PICO_OK`
- `PICO_INVALID_HANDLE`
- `PICO_NO_SAMPLES_AVAILABLE`
- `PICO_INVALID_CALL`
- `PICO_BUSY`
- `PICO_NOT_RESPONDING`
- `PICO_DRIVER_FUNCTION`
3.13 ps2000aGetTimebase() - find out what timebases are available

```c
PICO_STATUS ps2000aGetTimebase
(
    int16_t handle,
    uint32_t timebase,
    int32_t noSamples,
    int32_t * timeIntervalNanoseconds,
    int16_t oversample,
    int32_t * maxSamples
    uint32_t segmentIndex
)
```

This function calculates the sampling rate and maximum number of samples for a given timebase under the specified conditions. The result will depend on the number of channels enabled by the last call to `ps2000aSetChannel`.

This function is provided for use with programming languages that do not support the `float` data type. The value returned in the `timeIntervalNanoseconds` argument is restricted to integers. If your programming language supports the `float` type, we recommend that you use `ps2000aGetTimebase2` instead.

To use `ps2000aGetTimebase` or `ps2000aGetTimebase2`, first estimate the timebase number that you require using the information in the timebase guide. Next, call one of these functions with the timebase that you have just chosen and verify that the `timeIntervalNanoseconds` argument that the function returns is the value that you require. You may need to iterate this process until you obtain the time interval that you need.
### Applicability
All modes

### Arguments
- **handle**, device identifier returned by [ps2000aOpenUnit](#)
- **timebase**, see timebase guide
- **noSamples**, the number of samples required
  - * timeIntervalNanoseconds, on exit, the time interval between readings at the selected timebase. Use **NULL** if not required. In ETS mode this argument is not valid; use the sample time returned by [ps2000aSetEts](#) instead.
- **oversample**, not used
  - * maxSamples, on exit, the maximum number of samples available. The scope allocates a certain amount of memory for internal overheads and this may vary depending on the number of segments, number of channels enabled, and the timebase chosen. Use **NULL** if not required.
- **segmentIndex**, the index of the memory segment to use

### Returns
- **PICO_OK**
- **PICO_INVALID_HANDLE**
- **PICO_TOO_MANY_SAMPLES**
- **PICO_INVALID_CHANNEL**
- **PICO_INVALID_TIMEBASE**
- **PICO_INVALID_PARAMETER**
- **PICO_SEGMENT_OUT_OF_RANGE**
- **PICO_DRIVER_FUNCTION**
3.14 ps2000aGetTimebase2() - find out what timebases are available

```c
PICO_STATUS ps2000aGetTimebase2
(
    int16_t handle,
    uint32_t timebase,
    int32_t noSamples,
    float * timeIntervalNanoseconds,
    int16_t oversample,
    int32_t * maxSamples
    uint32_t segmentIndex
)
```

This function is an upgraded version of `ps2000aGetTimebase`, and returns the time interval as a `float` rather than a `long`. This allows it to return sub-nanosecond time intervals. See `ps2000aGetTimebase` for a full description.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>* <code>timeIntervalNanoseconds</code>, a pointer to the time interval between readings at the selected timebase. If a null pointer is passed, nothing will be written here. All other arguments: see <code>ps2000aGetTimebase</code></td>
</tr>
<tr>
<td><strong>Returns</strong></td>
<td>See <code>ps2000aGetTimebase</code></td>
</tr>
</tbody>
</table>
3.15 ps2000aGetTriggerTimeOffset() - find out when trigger occurred (32-bit)

```c
PICO_STATUS ps2000aGetTriggerTimeOffset
(
    int16_t handle,
    uint32_t * timeUpper,
    uint32_t * timeLower,
    PS2000A_TIME_UNITS * timeUnits,
    uint32_t segmentIndex
)
```

This function gets the time, as two 4-byte values, at which the trigger occurred. Call it after block-mode data has been captured or when data has been retrieved from a previous block-mode capture. A 64-bit version of this function, `ps2000aGetTriggerTimeOffset64`, is also available.

<table>
<thead>
<tr>

</tbody>
</table>
### 3.16 ps2000aGetTriggerTimeOffset64() - find out when trigger occurred (64-bit)

```c
PICO_STATUS ps2000aGetTriggerTimeOffset64
(
    int16_t handle,
    int64_t * time,
    PS2000A_TIME_UNITS * timeUnits,
    uint32_t segmentIndex
)
```

This function gets the time, as a single 64-bit value, at which the trigger occurred. Call it after block-mode data has been captured or when data has been retrieved from a previous block-mode capture. A 32-bit version of this function, `ps2000aGetTriggerTimeOffset`, is also available.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

| Returns               | PICO_OK |
|                       | PICO_INVALID_HANDLE |
|                       | PICO_DEVICE_SAMPLING |
|                       | PICO_SEGMENT_OUT_OF_RANGE |
|                       | PICO_NOT_USED_IN_THIS_CAPTURE_MODE |
|                       | PICO_NOT_RESPONDING |
|                       | PICO_NULL_PARAMETER |
|                       | PICO_NO_SAMPLES_AVAILABLE |
|                       | PICO_DRIVER_FUNCTION |
3.17 ps2000aGetUnitInfo() - get information about scope device

```c
PICO_STATUS ps2000aGetUnitInfo(
    int16_t handle,
    int8_t * string,
    int16_t stringLength,
    int16_t * requiredSize

    PICO_INFO info
)
```

This function retrieves information about the specified oscilloscope. If the device fails to open, or no device is opened only the driver version is available.

<table>
<thead>
<tr>

</tbody>
</table>
3.18 ps2000aGetValues() - get block-mode data with callback

```c
PICO_STATUS ps2000aGetValues
(
    int16_t handle,
    uint32_t startIndex,
    uint32_t * noOfSamples,
    uint32_t downSampleRatio,
    PS2000A_RATIO_MODE downSampleRatioMode,
    uint32_t segmentIndex,
    int16_t * overflow
)
```

This function returns block-mode data, with or without downsampling, starting at the specified sample number. It is used to get the stored data from the driver after data collection has stopped.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Block mode, rapid block mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>startIndex, a zero-based index that indicates the start point for data collection. It is measured in sample intervals from the start of the buffer.</td>
</tr>
<tr>
<td></td>
<td>* noOfSamples, on entry, the number of samples required. On exit, the actual number retrieved. The number of samples retrieved will not be more than the number requested, and the data retrieved starts at startIndex.</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>AGGREGATE, AVERAGE, DECIMATE are single-bit constants that can be ORed to apply multiple downsampling modes to the same data.</td>
</tr>
<tr>
<td></td>
<td>segmentIndex, the zero-based number of the memory segment where the data is stored</td>
</tr>
<tr>
<td></td>
<td>* overflow, on exit, a set of flags that indicate whether an overvoltage has occurred on any of the channels. It is a bit field with bit 0 denoting Channel A.</td>
</tr>
</tbody>
</table>
3.18.1 Downsampling modes

Various methods of data reduction, or downsampling, are possible with the PicoScope 2000 Series oscilloscopes. The downsampling is done at high speed by dedicated hardware inside the scope, making your application faster and more responsive than if you had to do all the data processing in software.

You specify the downsampling mode when you call one of the data collection functions such as `ps2000aGetValues`. The following modes are available:

- **PS2000A_RATIO_MODE_AGGREGATE**
  Reduces every block of \( n \) values to just two values: a minimum and a maximum. The minimum and maximum values are returned in two separate buffers.

- **PS2000A_RATIO_MODE_AVERAGE**
  Reduces every block of \( n \) values to a single value representing the average (arithmetic mean) of all the values. Equivalent to the ‘oversampling’ function on older scopes.

- **PS2000A_RATIO_MODE_DECIMATE**
  Reduces every block of \( n \) values to just the first value in the block, discarding all the other values.
3.19 ps2000aGetValuesAsync() - get streaming data with callback

```c
PICO_STATUS ps2000aGetValuesAsync
(
    int16_t handle,
    uint32_t startIndex,
    uint32_t noOfSamples,
    uint32_t downSampleRatio,
    PS2000A_RATIO_MODE downSampleRatioMode,
    uint32_t segmentIndex,
    void * lpDataReady,
    void * pParameter
)
```

This function returns data either with or without downsampling, starting at the specified sample number. It is used to get the stored data from the scope after data collection has stopped. It returns the data using a callback.

**Applicability**

| Streaming mode and block mode |

**Arguments**

| handle, device identifier returned by ps2000aOpenUnit |
| noOfSamples, see ps2000aGetValues |
| downSampleRatio, see ps2000aGetValues |
| downSampleRatioMode, see ps2000aGetValues |
| segmentIndex, see ps2000aGetValues |

* lpDataReady, a pointer to the user-supplied function that will be called when the data is ready. This will be a ps2000aDataReady function for block-mode data or a ps2000aStreamingReady function for streaming-mode data.

* pParameter, a void pointer that will be passed to the callback function. The data type is determined by the application.

**Returns**

| PICO_OK |
| PICO_INVALID_HANDLE |
| PICO_NO_SAMPLES_AVAILABLE |
| PICO_DEVICE_SAMPLING |
| PICO_NULL_PARAMETER |
| PICO_STARTINDEX_INVALID |
| PICO_SEGMENT_OUT_OF_RANGE |
| PICO_INVALID_PARAMETER |
| PICO_DATA_NOT_AVAILABLE |
| PICO_INVALID_SAMPLERATIO |
| PICO_INVALID_CALL |
| PICO_DRIVER_FUNCTION |
3.20 ps2000aGetValuesBulk() - get data in rapid block mode

**PICO_STATUS** ps2000aGetValuesBulk

```c
    int16_t handle,
    uint32_t * noOfSamples,
    uint32_t fromSegmentIndex,
    uint32_t toSegmentIndex,
    uint32_t downSampleRatio,
    PS2000A_RATIO_MODE downSampleRatioMode,
    int16_t * overflow
```

This function retrieves waveforms captured using rapid block mode. The waveforms must have been collected sequentially and in the same run.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Rapid block mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by ps2000aOpenUnit</td>
</tr>
<tr>
<td></td>
<td>* noOfSamples, on entry, the number of samples required; on exit, the actual number retrieved. The number of samples retrieved will not be more than the number requested. The data retrieved always starts with the first sample captured.</td>
</tr>
<tr>
<td></td>
<td>fromSegmentIndex, the first segment from which the waveform should be retrieved</td>
</tr>
<tr>
<td></td>
<td>toSegmentIndex, the last segment from which the waveform should be retrieved</td>
</tr>
<tr>
<td></td>
<td>downSampleRatio, see ps2000aGetValues</td>
</tr>
<tr>
<td></td>
<td>downSampleRatioMode, see ps2000aGetValues</td>
</tr>
<tr>
<td></td>
<td>* overflow, an array of integers equal to or larger than the number of waveforms to be retrieved. Each segment index has a corresponding entry in the overflow array, with overflow[0] containing the flags for the segment numbered fromSegmentIndex and the last element in the array containing the flags for the segment numbered toSegmentIndex. Each element in the array is a bit field as described under ps2000aGetValues.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>PICO_OK</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>
3.21 ps2000aGetValuesOverlapped() - set up data collection ahead of capture

```c
PICO_STATUS ps2000aGetValuesOverlapped
(
    int16_t handle,
    uint32_t startIndex,
    uint32_t * noOfSamples,
    uint32_t downSampleRatio,
    PS2000A_RATIO_MODE downSampleRatioMode,
    uint32_t segmentIndex,
    int16_t * overflow
)
```

This function allows you to make a deferred data-collection request in block mode. The request will be executed, and the arguments validated, when you call `ps2000aRunBlock`. The advantage of this function is that the driver makes contact with the scope only once, when you call `ps2000aRunBlock`, compared with the two contacts that occur when you use the conventional `ps2000aRunBlock, ps2000aGetValues` calling sequence. This slightly reduces the dead time between successive captures in block mode.

After calling `ps2000aRunBlock`, you can optionally use `ps2000aGetValues` to request further copies of the data. This might be required if you wish to display the data with different data reduction settings.

3.21.1 Using the GetValuesOverlapped functions

1. Open the oscilloscope using `ps2000aOpenUnit`.
2. Select channel ranges and AC/DC coupling using `ps2000aSetChannel`.
3. Using `ps2000aGetTimebase`, select timebases until the required nanoseconds per sample is located.
4. Use the trigger setup functions `ps2000aSetTriggerChannelDirections` and `ps2000aSetTriggerChannelProperties` to set up the trigger if required.
5. Wait until the oscilloscope is ready using the `ps2000aBlockReady` callback (or poll using `ps2000aIsReady`).
6. Use `ps2000aSetDataBuffer` to tell the driver where your memory buffer is.
7. Set up the transfer of the block of data from the oscilloscope using `ps2000aGetValuesOverlapped`.
8. Start the oscilloscope running using `ps2000aRunBlock`.
9. Display the data.
10. Stop the oscilloscope.
11. Repeat steps 8 and 9 if needed.

A similar procedure can be used with rapid block mode using the `ps2000aGetValuesOverlappedBulk` function.
3.22 ps2000aGetValuesOverlappedBulk() - set up data collection in rapid block mode

```c
PICO_STATUS ps2000aGetValuesOverlappedBulk
(
    int16_t handle,
    uint32_t startIndex,
    uint32_t * noOfSamples,
    uint32_t downSampleRatio,
    PS2000A_RATIO_MODE downSampleRatioMode,
    uint32_t fromSegmentIndex,
    uint32_t toSegmentIndex,
    int16_t * overflow
)
```

This function allows you to make a deferred data-collection request, which will later be executed, and the arguments validated, when you call `ps2000aRunBlock` in rapid block mode. The advantage of this method is that the driver makes contact with the scope only once, when you call `ps2000aRunBlock`, compared with the two contacts that occur when you use the conventional `ps2000aRunBlock, ps2000aGetValuesBulk` calling sequence. This slightly reduces the dead time between successive captures in rapid block mode. After calling `ps2000aRunBlock`, you can optionally use `ps2000aGetValues` to request further copies of the data. This might be required if you wish to display the data with different data reduction settings.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Rapid block mode</th>
</tr>
</thead>
</table>
| Arguments        | handle, device identifier returned by `ps2000aOpenUnit`
|                  | startIndex, see `ps2000aGetValues`
|                  | * noOfSamples, see `ps2000aGetValuesOverlapped`
|                  | downSampleRatio, see `ps2000aGetValues`
|                  | downSampleRatioMode, see `ps2000aGetValues`
|                  | fromSegmentIndex, see `ps2000aGetValuesBulk`
|                  | toSegmentIndex, see `ps2000aGetValuesBulk`
|                  | * overflow, see `ps2000aGetValuesBulk`
| Returns          | PICO_OK
|                  | PICO_INVALID_HANDLE
|                  | PICO_INVALID_PARAMETER
|                  | PICO_DRIVER_FUNCTION

This function requests data collection with `ps2000aGetValuesOverlappedBulk`, with a deferred call to `ps2000aRunBlock` where the arguments are validated and the data collection can be executed.
3.23 ps2000aGetValuesTriggerTimeOffsetBulk() - get rapid-block waveform times (32-bit)

```
PICO_STATUS ps2000aGetValuesTriggerTimeOffsetBulk
(
    int16_t handle,
    uint32_t * timesUpper,
    uint32_t * timesLower,
    PS2000A_TIME_UNITS * timeUnits,
    uint32_t fromSegmentIndex,
    uint32_t toSegmentIndex
)
```

This function retrieves the time offsets, as lower and upper 32-bit values, for waveforms obtained in **rapid block mode**. The time offset of a waveform is the delay from the trigger sampling instant to the time at which the driver estimates the waveform to have crossed the trigger threshold. You can add this offset to the time of each sample in the waveform to reduce trigger jitter. Without using the time offset, trigger jitter can be up to 1 sample period; adding the time offset reduces jitter to a small fraction of a sample period.

This function is provided for use in programming environments that do not support 64-bit integers. If your programming environment supports this data type, it is easier to use `ps2000aGetValuesTriggerTimeOffsetBulk64`. 
### Applicability
- **Rapid block mode**

### Arguments
- `handle`, device identifier returned by [ps2000aOpenUnit](#).

* `timesUpper`, an array of integers. On exit, the most significant 32 bits of the time offset for each requested segment index. `times[0]` will hold the `fromSegmentIndex` time offset and the last `times` index will hold the `toSegmentIndex` time offset. The array must be long enough to hold the number of requested times.

* `timesLower`, an array of integers. On exit, the least significant 32 bits of the time offset for each requested segment index. `times[0]` will hold the `fromSegmentIndex` time offset and the last `times` index will hold the `toSegmentIndex` time offset. The array size must be long enough to hold the number of requested times.

* `timeUnits`, an array of integers. The array must be long enough to hold the number of requested times. On exit, `timeUnits[0]` will contain the time unit for `fromSegmentIndex` and the last element will contain the time unit for `toSegmentIndex`. Refer to [ps2000aGetTriggerTimeOffset](#) for allowable values.

  * `fromSegmentIndex`, the first segment for which the time offset is required.
  * `toSegmentIndex`, the last segment for which the time offset is required. If `toSegmentIndex` is less than `fromSegmentIndex` then the driver will wrap around from the last segment to the first.

### Returns
- PICO_OK
- PICO_INVALID_HANDLE
- PICO_NOT_USED_IN_THIS_CAPTURE_MODE
- PICO_NOT_RESPONDING
- PICO_NULL_PARAMETER
- PICO_DEVICE_SAMPLING
- PICO_SEGMENT_OUT_OF_RANGE
- PICO_NO_SAMPLES_AVAILABLE
- PICO_DRIVER_FUNCTION
### 3.24 ps2000aGetValuesTriggerTimeOffsetBulk64() – get rapid-block waveform times (64-bit)

**PICO_STATUS** ps2000aGetValuesTriggerTimeOffsetBulk64

```c
int16_t handle,
int64_t * times,
PS2000A_TIME_UNITS * timeUnits,
uint32_t fromSegmentIndex,
uint32_t toSegmentIndex
```

This function retrieves the 64-bit time offsets for waveforms captured in **rapid block mode**.

A 32-bit version of this function, **ps2000aGetValuesTriggerTimeOffsetBulk**is available for use with programming languages that do not support 64-bit integers.

3.25 ps2000aHoldOff() – not supported

```c
PICO_STATUS ps2000aHoldOff
(
    int16_t handle,
    uint64_t holdoff,
    PS2000A_HOLDOFF_TYPE type
)
```

This function has no effect and is reserved for future use.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Not supported. Reserved for future use.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>holdoff, reserved for future use</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
3.26 ps2000aIsReady() – poll driver in block mode

```c
PICO_STATUS ps2000aIsReady
(
    int16_t    handle,
    int16_t    * ready
)
```

This function may be used instead of a callback function to receive data from `ps2000aRunBlock`. To use this method, pass a NULL pointer as the `lpReady` argument to `ps2000aRunBlock`. You must then poll the driver to see if it has finished collecting the requested samples.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Block mode</th>
</tr>
</thead>
</table>
| Arguments      | handle, device identifier returned by `ps2000aOpenUnit`
|                | ^ ready, output: indicates the state of the collection. If zero, the device is still collecting. If non-zero, the device has finished collecting and `ps2000aGetValues` can be used to retrieve the data. |
| Returns        | PICO_OK   |
|                | PICO_INVALID_HANDLE |
|                | PICO_DRIVER_FUNCTION |
|                | PICO_NULL_PARAMETER |
|                | PICO_NO_SAMPLES_AVAILABLE |
|                | PICO_CANCELLED |
|                | PICO_NOT_RESPONDING |
3.27  ps2000aIsTriggerOrPulseWidthQualifierEnabled() – get trigger status

```c
PICO_STATUS ps2000aIsTriggerOrPulseWidthQualifierEnabled
(    int16_t handle,
    int16_t * triggerEnabled,
    int16_t * pulseWidthQualifierEnabled
)
```

This function discovers whether a trigger, or pulse width triggering, is enabled.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Call after setting up the trigger, and just before calling either ps2000aRunBlock or ps2000aRunStreaming.</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by ps2000aOpenUnit  
* triggerEnabled, on exit, indicates whether the trigger will successfully be set when ps2000aRunBlock or ps2000aRunStreaming is called. A non-zero value indicates that the trigger is set, zero that the trigger is not set.  
* pulseWidthQualifierEnabled, on exit, indicates whether the pulse width qualifier will successfully be set when ps2000aRunBlock or ps2000aRunStreaming is called. A non-zero value indicates that the pulse width qualifier is set, zero that the pulse width qualifier is not set. |
| Returns       | PICO_OK  
PICO_INVALID_HANDLE  
PICO_NULL_PARAMETER  
PICO_DRIVER_FUNCTION |

3.28 ps2000aMaximumValue() – get maximum ADC count in get-values calls

```c
PICO_STATUS ps2000aMaximumValue
(
    int16_t handle,
    int16_t * value
)
```

This function returns the maximum ADC count returned by calls to the "GetValues" functions.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>* value, output: the maximum ADC value</td>
</tr>
<tr>

</tbody>
</table>
ps2000aMemorySegments() – divide scope memory into segments

```c
PICO_STATUS ps2000aMemorySegments
(
    int16_t handle,
    uint32_t nSegments,
    int32_t * nMaxSamples
)
```

This function sets the number of memory segments that the scope will use.

When the scope is opened, the number of segments defaults to 1, meaning that each capture fills the scope's available memory. This function allows you to divide the memory into a number of segments so that the scope can store several waveforms sequentially.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>nSegments, the number of segments required, from 1 to 32</td>
</tr>
<tr>
<td></td>
<td>* nMaxSamples, on exit, the number of samples available in each segment. This is the total number over all channels, so if more than one channel is in use then the number of samples available to each channel is nMaxSamples divided by the number of channels.</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_USER_CALLBACK</td>
</tr>
<tr>

</tbody>
</table>
3.30  ps2000aMinimumValue() – get minimum ADC count in get-values calls

```c
PICO_STATUS ps2000aMinimumValue
(
    int16_t handle,
    int16_t * value
)
```

This function returns the minimum ADC count returned by calls to the GetValues functions.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by `ps2000aOpenUnit`  
* value, output: the minimum ADC value |
| Returns       | PICO_OK  
PICO_USER_CALLBACK  
PICO_INVALID_HANDLE  
PICO_TOO_MANY_SEGMENTS  
PICO_MEMORY  
PICO_DRIVER_FUNCTION |
3.31  ps2000aNoOfStreamingValues() – get number of samples in streaming mode

```c
PICO_STATUS ps2000aNoOfStreamingValues
(  
    int16_t handle,
    uint32_t * noOfValues
)
```

This function returns the number of samples available after data collection in streaming mode. Call it after calling `ps2000aStop`.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Streaming mode</th>
</tr>
</thead>
</table>
| Arguments       | handle, device identifier returned by `ps2000aOpenUnit`  
|                 | * noOfValues, on exit, the number of samples |
| Returns         | PICO_OK  
|                 | PICO_INVALID_HANDLE  
|                 | PICO_NULL_PARAMETER  
|                 | PICO_NO_SAMPLESAVAILABLE  
|                 | PICO_NOT_USED  
|                 | PICO_BUSY  
|                 | PICO_DRIVER_FUNCTION |

3.32 ps2000aOpenUnit() – open a scope device

```c
PICO_STATUS ps2000aOpenUnit(
    int16_t * handle,  // * handle,
    int8_t * serial    // * serial
)
```

This function opens a PicoScope 2000 Series (A API) scope attached to the computer. The maximum number of units that can be opened depends on the operating system, the kernel driver and the computer.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>* handle, on exit, the result of the attempt to open a scope:</td>
</tr>
<tr>
<td></td>
<td>-1: if the scope fails to open</td>

</tr>
<tr>
<td></td>
<td>PICO_INITIALISE_FPGA</td>
</tr>
</tbody>
</table>
3.33 ps2000aOpenUnitAsync() – open a scope device without blocking

```c
PICO_STATUS ps2000aOpenUnitAsync
(
    int16_t * status,
    int8_t * serial
)
```

This function opens a scope without blocking the calling thread. You can find out when it has finished by periodically calling `ps2000aOpenUnitProgress` until that function returns a non-zero value.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| Arguments     | * status, a status code:  
|               |   0 if the open operation was disallowed because another open operation is in progress  
|               |   1 if the open operation was successfully started  
|               | * serial, see `ps2000aOpenUnit` |
| Returns       | PICO_OK  
|               | PICO_OPEN_OPERATION_IN_PROGRESS  
|               | PICO_OPERATION_FAILED |
3.34 ps2000aOpenUnitProgress() – check progress of OpenUnit call

```c
PICO_STATUS ps2000aOpenUnitProgress(
    int16_t * handle,
    int16_t * progressPercent,
    int16_t * complete
)
```

This function checks on the progress of a request made to `ps2000aOpenUnitAsync` to open a scope.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Use after <code>ps2000aOpenUnitAsync</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>* handle, see <code>ps2000aOpenUnit</code>. This handle is valid only if the function returns PICO_OK.</td>
</tr>
<tr>
<td></td>
<td>* progressPercent, on exit, the percentage progress towards opening the scope. 100% implies that the open operation is complete.</td>
</tr>
<tr>
<td></td>
<td>* complete, set to 1 when the open operation has finished</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER</td>
</tr>
<tr>
<td></td>
<td>PICO_OPERATION_FAILED</td>
</tr>
</tbody>
</table>
3.35 ps2000aPingUnit() – check communication with opened device

```c
PICO_STATUS ps2000aPingUnit(
    int16_t handle
);
```

This function can be used to check that the already opened device is still connected to the USB port and communication is successful.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK, PICO_INVALID_HANDLE, PICO_DRIVER_FUNCTION, PICO_BUSY, PICO_NOT RESPONDING</td>
</tr>
</tbody>
</table>
3.36 ps2000aQueryOutputEdgeDetect() – find out if state trigger edge-detection is enabled

```c
PICO_STATUS ps2000aQueryOutputEdgeDetect
    (int16_t handle,
     int16_t * state)
```

This function obtains the state of the edge-detect flag, which is described in `ps2000aSetOutputEdgeDetect`.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Level and window trigger types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>state, on exit, the value of the edge-detect flag:</td>
</tr>
<tr>
<td></td>
<td>0 : do not wait for a signal transition</td>
</tr>
<tr>
<td></td>
<td>&lt;&gt; 0 : wait for a signal transition (default)</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
</tbody>
</table>
3.37 ps2000aRunBlock() – capture in block mode

```c
PICO_STATUS ps2000aRunBlock
(
    int16_t handle,
    int32_t noOfPreTriggerSamples,
    int32_t noOfPostTriggerSamples,
    uint32_t timebase,
    int16_t oversample,
    int32_t * timeIndisposedMs,
    uint32_t segmentIndex,
    ps2000aBlockReady lpReady,
    void * pParameter
)
```

This function starts collecting data in block mode. For a step-by-step guide to this process, see Using block mode.

The number of samples is determined by `noOfPreTriggerSamples` and `noOfPostTriggerSamples` (see below for details). The total number of samples must not be more than the size of the segment referred to by `segmentIndex`.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Block mode, rapid block mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code>&lt;br&gt;noOfPreTriggerSamples, the number of samples to store before the trigger event&lt;br&gt;noOfPostTriggerSamples, the number of samples to store after the trigger event&lt;br&gt;Note: the maximum number of samples returned is always <code>noOfPreTriggerSamples</code> + <code>noOfPostTriggerSamples</code>. This is true even if no trigger event has been set.&lt;br&gt;timebase, a number in the range 0 to (2^{32} - 1). See the guide to calculating timebase values. This argument is ignored in ETS mode, when <code>ps2000aSetEts</code> selects the timebase instead.&lt;br&gt;oversample, not used&lt;br&gt;* <code>timeIndisposedMs</code>, on exit, the time, in milliseconds, that the scope will spend collecting samples. This does not include any auto trigger timeout. It is not valid in ETS capture mode. The pointer can be set to null if a value is not required.&lt;br&gt;segmentIndex, zero-based, which memory segment to use&lt;br&gt;lpReady, a pointer to the <code>ps2000aBlockReady</code> callback function that the driver will call when the data has been collected. To use the <code>ps2000aIsReady</code> polling method instead of a callback function, set this pointer to NULL.&lt;br&gt;* <code>pParameter</code>, a void pointer that is passed to the <code>ps2000aBlockReady</code> callback function. The callback can use this pointer to return arbitrary data to the application.</td>
</tr>
</tbody>
</table>

<p>| Returns             | PICO_OK&lt;br&gt;PICO_BUFFERS_NOT_SET (in Overlapped mode)&lt;br&gt;PICO_INVALID_HANDLE&lt;br&gt;PICO_USER_CALLBACK |</p>

    uint32_t overviewBufferSize
);

This function tells the oscilloscope to start collecting data in streaming mode. When data has been collected from the device it is downsampl ed if necessary and then delivered to the application. Call ps2000aGetStreamingLatestValues to retrieve the data. See Using streaming mode for a step-by-step guide to this process.

When a trigger is set, the total number of samples stored in the driver is the sum of maxPreTriggerSamples and maxPostTriggerSamples. If autoStop is false, this will become the maximum number of samples without downsampling.

### 3.39 ps2000aSetChannel() – set up input channel

```c
PICO_STATUS ps2000aSetChannel(
    int16_t handle,
    PS2000A_CHANNEL channel,
    int16_t enabled,
    PS2000A_COUPLING type,
    PS2000A_RANGE range,
    float analogOffset
)
```

This function specifies whether an input channel is to be enabled, its input coupling type, voltage range, analog offset.

<table>
<thead>
<tr>
<th><strong>Applicability</strong></th>
<th>All modes</th>
</tr>
</thead>
</table>
| **Arguments**     | handle, device identifier returned by `ps2000aOpenUnit` channel, the channel to be configured. The values are:  
  - PS2000A_CHANNEL_A: Channel A input  
  - PS2000A_CHANNEL_B: Channel B input  
  - PS2000A_CHANNEL_C: Channel C input  
  - PS2000A_CHANNEL_D: Channel D input  
  
  enabled, whether or not to enable the channel. The values are:  
  - TRUE: enable  
  - FALSE: do not enable  
  
  type, the impedance and coupling type. The values are:  
  - PS2000A_AC: 1 megohm impedance, AC coupling. The channel accepts input frequencies from about 1 hertz up to its maximum analog bandwidth.  
  - PS2000A_DC: 1 megohm impedance, DC coupling. The channel accepts all input frequencies from zero (DC) up to its maximum analog bandwidth.  
  
  range, the input voltage range:  
  - PS2000A_20MV: ±20 mV  
  - PS2000A_50MV: ±50 mV  
  - PS2000A_100MV: ±100 mV  
  - PS2000A_200MV: ±200 mV  
  - PS2000A_500MV: ±500 mV  
  - PS2000A_1V: ±1 V  
  - PS2000A_2V: ±2 V  
  - PS2000A_5V: ±5 V  
  - PS2000A_10V: ±10 V  
  - PS2000A_20V: ±20 V  

  analogOffset, a voltage to add to the input channel before digitization. The allowable range of offsets can be obtained from `ps2000aGetAnalogueOffset` and depends on the input range selected for the channel. This argument is ignored if the device is a PicoScope 2205 MSO. |

| **Returns**       | PICO_OK  
|                   | PICO_USER_CALLBACK  
|                   | PICO_INVALID_HANDLE

3.40  ps2000aSetDataBuffer() – register data buffer with driver

PICO_STATUS ps2000aSetDataBuffer
(
    int16_t handle,
    int32_t channel,
    int16_t * buffer,
    int32_t bufferLth,
    uint32_t segmentIndex,
    PS2000A_RATIO_MODE mode
)

This function tells the driver where to store the data, either unprocessed or downsampled, that will be returned after the next call to one of the GetValues functions. The function allows you to specify only a single buffer, so for aggregation mode, which requires two buffers, you need to call ps2000aSetDataBuffers instead.

You must allocate memory for the buffer before calling this function.

<table>
<thead>
<tr>

</tbody>
</table>
3.41  ps2000aSetDataBuffers() – register aggregated data buffers with driver

PICO_STATUS ps2000aSetDataBuffers
(
    int16_t handle,
    int32_t channel,
    int16_t * bufferMax,
    int16_t * bufferMin,
    int32_t bufferLth,
    uint32_t segmentIndex,
    PS2000A_RATIO_MODE mode
)

This function tells the driver the location of one or two buffers for receiving data. You need to allocate memory for the buffers before calling this function. If you do not need two buffers, because you are not using aggregate mode, you can optionally use ps2000aSetDataBuffer instead.

**Applicability**

Block and streaming modes with aggregation.

**Arguments**

- handle, device identifier returned by ps2000aOpenUnit
- channel, the channel for which you want to set the buffers. Use one of these constants:
  - PS2000A_CHANNEL_A
  - PS2000A_CHANNEL_B
  - PS2000A_CHANNEL_C
  - PS2000A_CHANNEL_D

To set the buffer for a digital port (MSO models only), use one of these values:
- PS2000A_DIGITAL_PORT0 = 0x80
- PS2000A_DIGITAL_PORT1 = 0x81

- * bufferMax, a buffer to receive the maximum data values in aggregation mode, or the non-aggregated values otherwise

- * bufferMin, a buffer to receive the minimum aggregated data values. Not used in other downsampling modes

- bufferLth, the size of the bufferMax and bufferMin arrays

- segmentIndex, the number of the memory segment to be used

**Returns**

- PICO_OK
- PICO_INVALID_HANDLE
- PICO_INVALID_CHANNEL
- PICO_RATIO_MODE_NOT_SUPPORTED
- PICO_SEGMENT_OUT_OF_RANGE
- PICO_DRIVER_FUNCTION
- PICO_INVALID_PARAMETER
3.42 ps2000aSetDigitalAnalogTriggerOperand() – set up combined analog/digital trigger

```c
PICO_STATUS ps2000aSetDigitalAnalogTriggerOperand(
    int16_t handle,
    PS2000A_TRIGGER_OPERAND operand
)
```

Mixed-signal (MSO) models in this series have two independent triggers, one for the analog input channels and another for the digital inputs. This function defines how the two triggers are combined.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>MSO models only</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by ps2000aOpenUnit
                operand, one of the following constants:
                - PS2000A_OPERAND_NONE, ignore the trigger settings
                - PS2000A_OPERAND_OR, fire when either trigger is activated
                - PS2000A_OPERAND_AND, fire when both triggers are activated
                - PS2000A_OPERAND_THEN, fire when one trigger is activated followed by the other
| Returns        | PICO_OK
                PICO_INVALID_HANDLE
                PICO_DRIVER_FUNCTION
                PICO_NOT_USED
                PICO_INVALID_PARAMETER |
3.43 ps2000aSetDigitalPort() – set up digital input

```
PICO_STATUS ps2000aSetDigitalPort
(
    int16_t handle,
    PS2000A_DIGITAL_PORT port,
    int16_t enabled,
    int16_t logiclevel
)
```

This function is used to enable the digital ports of an MSO and set the logic level (the voltage point at which the state transitions from 0 to 1).

<table>
<thead>
<tr>
<th>Applicability</th>
<th>MSO devices only. Block and streaming modes with aggregation. Not compatible with ETS mode.</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by ps2000aOpenUnit port, the digital port to be configured:  
|               | PS2000A_DIGITAL_PORT0 = 0x80 (D0 to D7)  
|               | PS2000A_DIGITAL_PORT1 = 0x81 (D8 to D15)  
|               | enabled, whether or not to enable the channel. The values are:  
|               | TRUE: enable  
|               | FALSE: do not enable  
|               | logiclevel, the logic threshold voltage  
|               | Range: –32767 (–5 V) to 32767 (5 V). |
| Returns       | PICO_OK  
|               | PICO_INVALID_HANDLE  
|               | PICO_INVALID_CHANNEL  
|               | PICO_RATIO_MODE_NOT_SUPPORTED  
|               | PICO_SEGMENT_OUT_OF_RANGE  
|               | PICO_DRIVER_FUNCTION  
|               | PICO_INVALID_PARAMETER |
3.44 ps2000aSetEts() – set up equivalent-time sampling

```c
PICO_STATUS ps2000aSetEts(
    int16_t handle,
    PS2000A_ETS_MODE mode,
    int16_t etsCycles,
    int16_t etsInterleave,
    int32_t * sampleTimePicoseconds
)
```

This function is used to enable or disable ETS (equivalent-time sampling) and to set the ETS parameters. See ETS overview for an explanation of ETS mode.

**Applicability**

<table>
<thead>
<tr>
<th>Block mode only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>On MSOs, ETS mode not available when digital port(s) enabled.</td>
</tr>
</tbody>
</table>

**Arguments**

| handle, device identifier returned by ps2000aOpenUnit |
| mode, the ETS mode. Use one of these values: |
| PS2000A_ETS_OFF: disables ETS |
| PS2000A_ETS_FAST: enables ETS and provides etsCycles of data, which may contain data from previously returned cycles |
| PS2000A_ETS_SLOW: enables ETS and provides fresh data every etsCycles. This mode takes longer to provide each data set, but the data sets are more stable and are guaranteed to contain only new data. |

| etsCycles, the number of cycles to store: the computer can then select etsInterleave cycles to give the most uniform spread of samples. |
| Range: between two and five times the value of etsInterleave, and not more than the appropriate MAX_ETS_CYCLES constant: |
| 500 for the PicoScope 2206B, 2206B MSO, 2207B, 2207B MSO, 2208B, 2208B MSO, 2405A, 2406B, 2407B, 2408B |
| PS2206_MAX_ETS_CYCLES for the PicoScope 2206, 2206A |
| PS2207_MAX_ETS_CYCLES for the PicoScope 2207, 2207A |
| PS2208_MAX_ETS_CYCLES for the PicoScope 2208, 2208A |

| etsInterleave, the number of waveforms to combine into a single ETS capture. |
| Maximum value is: |
| 40 for the PicoScope 2206B, 2206B MSO, 2207B, 2207B MSO, 2208B, 2208B MSO, 2405A, 2406B, 2407B, 2408B |
| PS2206_MAX_INTERLEAVE for the PicoScope 2206, 2206A |
| PS2207_MAX_INTERLEAVE for the PicoScope 2207, 2207A |
| PS2208_MAX_INTERLEAVE for the PicoScope 2208, 2208A |

| * sampleTimePicoseconds, on exit, the effective sampling interval of the ETS data. For example, if the captured sample time is 4 ns and etsInterleave is 10, then the effective sample time in ETS mode is 400 ps. |

**Returns**

| PICO_OK |
| PICO_USER_CALLBACK |
| PICO_INVALID_HANDLE |
| PICO_INVALID_PARAMETER |
| PICO_DRIVER_FUNCTION |
3.45  ps2000aSetEtsTimeBuffer() – set up 64-bit buffer for ETS timings

```c
PICO_STATUS ps2000aSetEtsTimeBuffer
    (int16_t handle,
     int64_t * buffer,
     int32_t bufferLth)
```

This function tells the driver where to find your application’s ETS time buffers. These buffers contain the 64-bit timing information for each ETS sample after you run a block-mode ETS capture.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>ETS mode only.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If your programming language does not support 64-bit data, use the 32-bit version ps2000aSetEtsTimeBuffers instead.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Arguments</th>
<th>handle, device identifier returned by ps2000aOpenUnit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>* buffer, an array of 64-bit words, each representing the time in femtoseconds (10^{-15}) s at which the sample was captured</td>
</tr>
<tr>
<td></td>
<td>bufferLth, the size of the buffer array</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>PICO_OK</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>

3.46 ps2000aSetEtsTimeBuffers() – set up 32-bit buffers for ETS timings

```c
PICO_STATUS ps2000aSetEtsTimeBuffers(
    int16_t handle,
    uint32_t * timeUpper,
    uint32_t * timeLower,
    int32_t bufferLth
)
```

This function tells the driver where to find your application’s ETS time buffers. These buffers contain the timing information for each ETS sample after you run a block-mode ETS capture. There are two buffers containing the upper and lower 32-bit parts of the timing information, to allow programming languages that do not support 64-bit data to retrieve the timings.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>ETS mode only.</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by `ps2000aOpenUnit`
|               | * timeUpper, an array of 32-bit words, each representing the upper 32 bits of the time in femtoseconds ($10^{-15}$ s) at which the sample was captured
|               | * timeLower, an array of 32-bit words, each representing the lower 32 bits of the time in femtoseconds ($10^{-15}$ s) at which the sample was captured
|               | bufferLth, the size of the timeUpper and timeLower arrays |
| Returns       | PICO_OK
|               | PICO_INVALID_HANDLE
|               | PICO_NULL_PARAMETER
|               | PICO_DRIVER_FUNCTION |
3.47 ps2000aSetNoOfCaptures() – set number of captures to collect in one run

```c
PICO_STATUS ps2000aSetNoOfCaptures
(int16_t handle,
 uint32_t nCaptures)
```

This function sets the number of captures to be collected in one run of **rapid block mode**. If you do not call this function before a run, the driver will capture only one waveform. Once a value has been set, the value remains constant unless changed.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Rapid block mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code> nCaptures, the number of waveforms to capture in one run</td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_PARAMETER</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>
### 3.48 ps2000aSetOutputEdgeDetect() – enable or disable state trigger edge-detection

The function tells the device whether or not to wait for an edge on the trigger input when one of the 'level' or 'window' trigger types is in use. By default, the device waits for an edge on the trigger input before firing the trigger. If you switch off edge detect mode, the device will trigger continually for as long as the trigger input remains in the specified state.

You can query the state of this flag by calling `ps2000aQueryOutputEdgeDetect`.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Level and window trigger types</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code>&lt;br&gt;state, a flag that specifies the trigger behavior:&lt;br&gt;0: do not wait for a signal transition&lt;br&gt;&gt; 0: wait for a signal transition (default)</td>
</tr>
<tr>
<td><strong>Returns</strong></td>
<td>PICO_OK</td>
</tr>
</tbody>
</table>

```c
PICO_STATUS ps2000aSetOutputEdgeDetect
(
    int16_t handle,
    int16_t state
)
```
3.49 ps2000aSetPulseWidthDigitalPortProperties() – set pulse-width triggering on digital inputs

```c
PICO_STATUS ps2000aSetPulseWidthDigitalPortProperties(
    int16_t handle,
    PS2000A_DIGITAL_CHANNEL_DIRECTIONS* directions,
    int16_t nDirections
)
```

This function will set the individual digital channels' pulse-width trigger directions. Each trigger direction consists of a channel name and a direction. If the channel is not included in the array of `PS2000A_DIGITAL_CHANNEL_DIRECTIONS` the driver assumes the digital channel's pulse-width trigger direction is `PS2000A_DIGITAL_DONT_CARE`.

**Applicability**

- All modes.
- **MSO** models only.

**Arguments**

- `handle`, device identifier returned by `ps2000aOpenUnit`
- `* directions`, a pointer to an array of `PS2000A_DIGITAL_CHANNEL_DIRECTIONS` structures describing the requested properties. The array can contain a single element describing the properties of one channel, or a number of elements describing several digital channels. If `directions` is NULL, digital pulse-width triggering is switched off. A digital channel that is not included in the array will be set to `PS2000A_DIGITAL_DONT_CARE`.
- `nDirections`, the number of digital channel directions being passed to the driver

**Returns**

- `PICO_OK`
- `PICO_INVALID_HANDLE`
- `PICO_DRIVER_FUNCTION`
- `PICO_INVALID_DIGITAL_CHANNEL`
- `PICO_INVALID_DIGITAL_TRIGGER_DIRECTION`
3.50 ps2000aSetPulseWidthQualifier() – set up pulse width triggering

```c
PICO_STATUS ps2000aSetPulseWidthQualifier

(int16_t handle,
 PS2000A_PWQ_CONDITIONS* conditions,
 int16_t nConditions,
 PS2000A_THRESHOLD_DIRECTION direction,
 uint32_t lower,
 uint32_t upper,
 PS2000A_PULSE_WIDTH_TYPE type)
```

This function sets up the conditions for pulse width qualification, which is used with either threshold triggering, level triggering or window triggering to produce time-qualified triggers.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by ps2000aOpenUnit
                * conditions, an array of PS2000A_PWQ_CONDITIONS structures specifying the conditions that should be applied to each channel. In the simplest case, the array consists of a single element. When there are several elements, the overall trigger condition is the logical OR of all the elements. Since each element can combine a number of input conditions using AND logic, this AND-OR logic enables you to create a qualifier based on any possible Boolean function of the inputs. If conditions is NULL then the pulse-width qualifier is not used.
                nConditions, the number of elements in the conditions array. If nConditions is zero then the pulse-width qualifier is not used.
                Range: 0 to PS2000A_MAX_PULSE_WIDTH_QUALIFIER_COUNT.
                direction, the direction of the signal required for the pulse width trigger to fire. See PS2000A_THRESHOLD_DIRECTION constants for the list of possible values. Each channel of the oscilloscope (except the EXT input) has two thresholds for each direction—for example, PS2000A_RISING and PS2000A_RISING_LOWER—so that one can be used for the pulse-width qualifier and the other for the level trigger. The driver will not let you use the same threshold for both triggers; so, for example, you cannot use PS2000A_RISING as the direction argument for both ps2000aSetTriggerConditions and ps2000aSetPulseWidthQualifier at the same time. There is no such restriction when using window triggers.
                lower, the lower limit of the pulse-width counter, measured in sample periods
                upper, the upper limit of the pulse-width counter, measured in sample periods. This parameter is used only when the type is set to PS2000A_PW_TYPE_IN_RANGE or PS2000A_PW_TYPE_OUT_OF_RANGE.
                type, the pulse-width type, one of these constants:
                PS2000A_PW_TYPE_NONE: do not use the pulse width qualifier
                PS2000A_PW_TYPE_LESS_THAN: pulse width less than lower
                PS2000A_PW_TYPE_GREATER_THAN: pulse width greater than lower
                PS2000A_PW_TYPE_IN_RANGE: pulse width between lower and upper
                PS2000A_PW_TYPE_OUT_OF_RANGE: pulse width not between lower and upper
```

3.50.1 PS2000A_PWQ_CONDITIONS structure

A structure of this type is passed to `ps2000aSetPulseWidthQualifier` in the `conditions` argument to specify a set of trigger conditions. It is defined as follows:

```c
typedef struct tPS2000APwqConditions
{
    PS2000A_TRIGGER_STATE channelA;
    PS2000A_TRIGGER_STATE channelB;
    PS2000A_TRIGGER_STATE channelC;
    PS2000A_TRIGGER_STATE channelD;
    PS2000A_TRIGGER_STATE external;
    PS2000A_TRIGGER_STATE aux;
    PS2000A_TRIGGER_STATE digital;
} PS2000A_PWQ_CONDITIONS
```

The resulting trigger condition is the logical AND of the conditions applied to all the inputs. An array of these structures can be passed to `ps2000aSetPulseWidthQualifier`, which ORs them to produce the final pulse width qualifier. This method can generate any possible Boolean function of the scope’s input conditions.

The structure is byte-aligned. In C++, for example, you should specify this using the `#pragma pack()` instruction.

<table>
<thead>
<tr>
<th>Elements</th>
<th>channelA, channelB, channelC, channelD, external: the type of condition that should be applied to each channel. Use these constants:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PS2000A_CONDITION_DONT_CARE</td>
</tr>
<tr>
<td></td>
<td>PS2000A_CONDITION_TRUE</td>
</tr>
<tr>
<td></td>
<td>PS2000A_CONDITION_FALSE</td>
</tr>
</tbody>
</table>

The channels that are set to `PS2000A_CONDITION_TRUE` or `PS2000A_CONDITION_FALSE` must all meet their conditions simultaneously to produce a trigger. Channels set to `PS2000A_CONDITION_DONT_CARE` are ignored.

| aux, digital: not used |

not used
3.51 ps2000aSetSigGenArbitrary() - set up arbitrary waveform generator

```c
PICO_STATUS ps2000aSetSigGenArbitrary (int16_t handle, int32_t offsetVoltage, uint32_t pkToPk, int32_t startDeltaPhase, int32_t stopDeltaPhase, uint32_t deltaPhaseIncrement, uint32_t dwellCount, int32_t * arbitraryWaveform, int32_t arbitraryWaveformSize, PS2000A_Sweep_Type sweepType, PS2000A_EXTRA_OPERATIONS operation, PS2000A_INDEX_MODE indexMode, uint32_t shots, uint32_t sweeps, PS2000A_SIGGEN_TRIG_TYPE triggerType, PS2000A_SIGGEN_TRIG_SOURCE triggerSource, int16_t extInThreshold)
```

This function programs the signal generator to produce an arbitrary waveform.

The arbitrary waveform generator uses direct digital synthesis (DDS). It maintains a 32-bit phase accumulator that indicates the present location in the waveform. The top bits of the phase accumulator are used as an index into a buffer containing the arbitrary waveform. The remaining bits act as the fractional part of the index, enabling high-resolution control of output frequency and allowing the generation of lower frequencies.

The phase accumulator initially increments by `startDeltaPhase`. If the AWG is set to sweep mode, the phase increment is increased at specified intervals until it reaches `stopDeltaPhase`. The easiest way to obtain the values of `startDeltaPhase` and `stopDeltaPhase` necessary to generate the desired frequency is to call `ps2000aSigGenFrequencyToPhase`. Alternatively, see Calculating deltaPhase below for more information on how to calculate these values.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td></td>
</tr>
</tbody>
</table>
| ```
handle, device identifier returned by ps2000aOpenUnit
offsetVoltage, the voltage offset, in microvolts, to be applied to the waveform
pkToPk, the peak-to-peak voltage, in microvolts, of the waveform signal
startDeltaPhase, the initial value added to the phase accumulator as the generator begins to step through the waveform buffer. Calculate this value from the information above, or use ps2000aSigGenFrequencyToPhase.
stopDeltaPhase, the final value added to the phase accumulator before the generator restarts or reverses the sweep. When frequency sweeping is not required, set equal to startDeltaPhase.
``` | |
deltaPhaseIncrement, the amount added to the delta phase value every time the dwellCount period expires. This determines the amount by which the generator sweeps the output frequency in each dwell period. When frequency sweeping is not required, set to zero.

dwellCount, the time, in multiples of ddsPeriod, between successive additions of deltaPhaseIncrement to the delta phase accumulator. This determines the rate at which the generator sweeps the output frequency. Minimum value: PS2000A_MIN_DWELL_COUNT

* arbitraryWaveform, a buffer that holds the waveform pattern as a set of samples equally spaced in time. Each sample is scaled to an output voltage as follows:

\[ v_{OUT} = 1 \mu V \times \left( \frac{pkToPk}{2} \right) \times \left( \frac{sample\_value}{32767} \right) + offsetVoltage \]

and clipped to the overall ±2 V range of the AWG.

arbitraryWaveformSize, the size of the arbitrary waveform buffer, in samples, in the range:

\[
[minArbitraryWaveformSize, maxArbitraryWaveformSize]
\]

where minArbitraryWaveformSize and maxArbitraryWaveformSize are the values returned by ps2000aSigGenArbitraryMinMaxValues.

sweepType, determines whether the startDeltaPhase is swept up to the stopDeltaPhase, or down to it, or repeatedly swept up and down. Use one of these values:

- PS2000A_UP
- PS2000A_DOWN
- PS2000A_UPDOWN
- PS2000A_DOWNUP

operation, the type of waveform to be produced, specified by one of the following enumerated types:

- PS2000A_ES_OFF, normal AWG operation using the waveform buffer.
- PS2000A_WHITENOISE, the signal generator produces white noise and ignores all settings except offsetVoltage and pkToPk.
- PS2000A_PRBS, produces a random bitstream with a bit rate specified by the phase accumulator.

indexMode, specifies how the signal will be formed from the arbitrary waveform data. Single and dual index modes are possible. Use one of these constants:

- PS2000A_SINGLE
- PS2000A_DUAL

shots,

- 0: sweep the frequency as specified by sweeps
- 1..PS2000A_MAX_SWEEPS_SHOTS: the number of cycles of the waveform to be produced after a trigger event. sweeps must be zero.
- PS2000A_SHOT_SWEEP_TRIGGER_CONTINUOUS_RUN: start and run continuously after trigger occurs (not PicoScope 2205 MSO)

sweeps,

- 0: produce number of cycles specified by shots
- 1..PS2000A_MAX_SWEEPS_SHOTS: the number of times to sweep the frequency after a trigger event, according to sweepType. shots must be zero.
- PS2000A_SHOT_SWEEP_TRIGGER_CONTINUOUS_RUN: start a sweep and continue after trigger occurs (not PicoScope 2205 MSO)

triggerType, the type of trigger that will be applied to the signal generator:
triggerSource, the source that will trigger the signal generator:

- **PS2000A_SIGGEN_NONE** run without waiting for trigger
- **PS2000A_SIGGEN_SCOPE_TRIG** use scope trigger
- **PS2000A_SIGGEN_EXT_IN** use EXT input (if available)
- **PS2000A_SIGGEN_SOFT_TRIG** wait for software trigger provided by `ps2000aSigGenSoftwareControl`
- **PS2000A_SIGGEN_TRIGGER_RAW** reserved

If a trigger source other than **P2000A_SIGGEN_NONE** is specified, then either shots or sweeps, but not both, must be non-zero.

---

3.51.1 AWG index modes

The arbitrary waveform generator supports **single** and **dual** index modes to help you make the best use of the waveform buffer.

**Single mode.** The generator outputs the raw contents of the buffer repeatedly. This mode is the only one that can generate asymmetrical waveforms. You can also use this mode for symmetrical waveforms, but the dual and quad modes make more efficient use of the buffer memory.
Dual mode. The generator outputs the contents of the buffer from beginning to end, and then does a second pass in the reverse direction through the buffer. This allows you to specify only the first half of a waveform with twofold symmetry, such as a Gaussian function, and let the generator fill in the other half.

3.51.2 Calculating deltaPhase

The arbitrary waveform generator (AWG) steps through the waveform buffer by adding a deltaPhase value between 1 and phaseAccumulatorSize-1 to the phase accumulator every ddsPeriod (1/ddsFrequency). If the deltaPhase is constant, the generator produces a waveform at a constant frequency that can be calculated as follows:

\[
outputFrequency = ddsFrequency \times \left( \frac{\text{deltaPhase}}{\text{phaseAccumulatorSize}} \right) \times \left( \frac{\text{awgBufferSize}}{\text{arbitraryWaveformSize}} \right)
\]

where:

- \(outputFrequency\) = repetition rate of the complete arbitrary waveform
- \(ddsFrequency\) = update rate of DDS counter for each model
- \(deltaPhase\) = calculated from startDeltaPhase and deltaPhaseIncrement (we recommend that you use ps2000aSigGenFrequencyToPhase to calculate deltaPhase)
- \(phaseAccumulatorSize\) = 2\(^{32}\) for all models
- \(awgBufferSize\) = AWG buffer size for each model
- \(arbitraryWaveformSize\) = length in samples of the user-defined waveform

It is also possible to sweep the frequency by continually modifying the deltaPhase. This is done by setting up a deltaPhaseIncrement that the oscilloscope adds to the deltaPhase at intervals specified by dwellCount.

3.52 ps2000aSetSigGenBuiltIn() – set up standard signal generator

**PICO_STATUS** ps2000aSetSigGenBuiltIn

```c
int16_t handle,
int32_t offsetVoltage,
uint32_t pkToPk
int16_t waveType
float startFrequency,
float stopFrequency,
float increment,
float dwellTime,
PS2000A_SWEEP_TYPE sweepType,
PS2000A_EXTRA_OPERATIONS operation,
uint32_t shots,
uint32_t sweeps,
PS2000A_SIGGEN_TRIG_TYPE triggerType,
PS2000A_SIGGEN_TRIG_SOURCE triggerSource,
int16_t extInThreshold
```

This function sets up the signal generator to produce a signal from a list of built-in waveforms. If different start and stop frequencies are specified, the device will sweep either up, down, or up and down.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>

**Arguments**

- `handle`, device identifier returned by [ps2000aOpenUnit](#)
- `offsetVoltage`, the voltage offset, in microvolts, to be applied to the waveform
- `pkToPk`, the peak-to-peak voltage, in microvolts, of the waveform signal

Note: if the signal voltages described by the combination of `offsetVoltage` and `pkToPk` extend outside the voltage range of the signal generator, the output waveform will be clipped.

- `waveType`, the type of waveform to be generated:
  - `PS2000A_SINE` sine wave
  - `PS2000A_SQUARE` square wave
  - `PS2000A_TRIANGLE` triangle wave
  - `PS2000A_DC_VOLTAGE` DC voltage
  - `PS2000A_RAMP_UP` rising sawtooth
  - `PS2000A_RAMP_DOWN` falling sawtooth
  - `PS2000A_SINC` sin(x)/x
  - `PS2000A_GAUSSIAN` Gaussian
  - `PS2000A_HALF_SINE` half (full-wave rectified) sine

- `startFrequency`, the frequency that the signal generator will initially produce. Allowable values are between one of these constants:
  - `PS2000A_MIN_FREQUENCY`
  - `PS2000A_PRBS_MIN_FREQUENCY`
and one of these constants:

```
PS2000A_SINE_MAX_FREQUENCY
PS2000A_SQUARE_MAX_FREQUENCY
PS2000A_TRIANGLE_MAX_FREQUENCY
PS2000A_SINC_MAX_FREQUENCY
PS2000A_RAMP_MAX_FREQUENCY
PS2000A_HALF_SINE_MAX_FREQUENCY
PS2000A_GAUSSIAN_MAX_FREQUENCY
PS2000A_PRBS_MAX_FREQUENCY
```

depending on the signal type.

- **stopFrequency**, the frequency at which the sweep reverses direction or returns to the initial frequency
- **increment**, the amount of frequency increase or decrease in sweep mode
- **dwellTime**, the time for which the sweep stays at each frequency, in seconds
- **sweepType**, whether the frequency will sweep from **startFrequency** to **stopFrequency**, or in the opposite direction, or repeatedly reverse direction. Use one of these constants:
  - PS2000A_UP
  - PS2000A_DOWN
  - PS2000A_UPDOWN
  - PS2000A_DOWNUP

- **operation**, the type of waveform to be produced, specified by one of the following enumerated types:
  - PS2000A_ES_OFF, normal signal generator operation specified by **waveType**.
  - PS2000A_WHITENOISE, the signal generator produces white noise and ignores all settings except **pkToPk** and **offsetVoltage**.
  - PS2000A_PRBS, produces a random bitstream with a bit rate specified by the start and stop frequency (not available on PicoScope 2205 MSO).

**shots**, see `ps2000aSigGenArbitrary`

**sweeps**, see `ps2000aSigGenArbitrary`

**triggerType**, see `ps2000aSigGenArbitrary`

**triggerSource**, see `ps2000aSigGenArbitrary`

**extInThreshold**, see `ps2000aSigGenArbitrary`

### 3.56 ps2000aSetSimpleTrigger() – set up level triggers

```c
PICO_STATUS ps2000aSetSimpleTrigger
(
    int16_t handle,
    int16_t enable,
    PS2000A_CHANNEL source,
    int16_t threshold,
    PS2000A_THRESHOLD_DIRECTION direction,
    uint32_t delay,
    int16_t autoTrigger_ms
)
```

This function simplifies arming the trigger. It supports only the LEVEL trigger types and does not allow more than one channel to have a trigger applied to it. Any previous pulse width qualifier is canceled.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
</tbody>
</table>
3.57 ps2000aSetTriggerChannelConditions() – specify which channels to trigger on

```c
PICO_STATUS ps2000aSetTriggerChannelConditions( int16_t handle,
                                              PS2000A_TRIGGER_CONDITIONS* conditions,
                                              int16_t nConditions )
```

This function sets up trigger conditions on the scope's inputs. The trigger is defined by one or more `PS2000A_TRIGGER_CONDITIONS` structures that are then ORed together. Each structure is itself the AND of the states of one or more of the inputs. This AND-OR logic allows you to create any possible Boolean function of the scope's inputs.

If complex triggering is not required, use `ps2000aSetSimpleTrigger`.

<table>
<thead>

</table>
3.57.1 PS2000A_TRIGGER_CONDITIONS structure

A structure of this type is passed to \texttt{ps2000aSetTriggerChannelConditions} in the \texttt{conditions} argument to specify the trigger conditions, and is defined as follows:

\begin{verbatim}
typedef struct tPS2000ATriggerConditions
{
    PS2000A_TRIGGER_STATE   channelA;
    PS2000A_TRIGGER_STATE   channelB;
    PS2000A_TRIGGER_STATE   channelC;
    PS2000A_TRIGGER_STATE   channelD;
    PS2000A_TRIGGER_STATE   external;
    PS2000A_TRIGGER_STATE   aux;
    PS2000A_TRIGGER_STATE   pulseWidthQualifier;
    PS2000A_TRIGGER_STATE   digital;
} PS2000A_TRIGGER_CONDITIONS
\end{verbatim}

Each structure is the logical AND of the states of the scope’s inputs. The \texttt{ps2000aSetTriggerChannelConditions} function can OR together a number of these structures to produce the final trigger condition, which can be any possible Boolean function of the scope’s inputs.

The structure is byte-aligned. In C++, for example, you should specify this using the \#pragma pack() instruction.

<table>
<thead>
<tr>
<th>Elements</th>
<th>channelA, channelB, channelC, channelD, external, pulseWidthQualifier: the type of condition that should be applied to each channel. Use these constants:</th>

3.59 ps2000aSetTriggerChannelProperties() – set up trigger thresholds

```c
PICO_STATUS ps2000aSetTriggerChannelProperties(
    int16_t handle,
    PS2000A_TRIGGER_CHANNEL_PROPERTIES* channelProperties,
    int16_t nChannelProperties,
    int6_t auxOutputEnable,
    int32_t autoTriggerMilliseconds
)
```

This function is used to enable or disable triggering and set its parameters.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by `ps2000aOpenUnit`
|               | * channelProperties, a pointer to an array of `PS2000A_TRIGGER_CHANNEL_PROPERTIES` structures describing the requested properties. The array can contain a single element describing the properties of one channel, or a number of elements describing several channels. If NULL is passed, triggering is switched off.
|               | nChannelProperties, the size of the channelProperties array. If zero, triggering is switched off.
|               | auxOutputEnable, not used
|               | autoTriggerMilliseconds, the time in milliseconds for which the scope device will wait before collecting data if no trigger event occurs. If this is set to zero, the scope device will wait indefinitely for a trigger. |
| Returns       | PICO_OK
|               | PICO_INVALID_HANDLE
|               | PICO_USER_CALLBACK
|               | PICO_TRIGGER_ERROR

|               | PICO_INVALID_PARAMETER |
3.59.1  PS2000A_TRIGGER_CHANNEL_PROPERTIES structure

A structure of this type is passed to \texttt{ps2000aSetTriggerChannelProperties} in the \texttt{channelProperties} argument to specify the trigger mechanism, and is defined as follows:

\begin{verbatim}
typedef struct tPS2000ATriggerChannelProperties
{
    int16_t    thresholdUpper;
    uint16_t   thresholdUpperHysteresis;
    int16_t    thresholdLower;
    uint16_t   thresholdLowerHysteresis;
    PS2000A_CHANNEL channel;
    PS2000A_THRESHOLD_MODE thresholdMode;
} PS2000A_TRIGGER_CHANNEL_PROPERTIES
\end{verbatim}

The structure is byte-aligned. In C++, for example, you should specify this using the \texttt{#pragma pack()} instruction.

**Upper and lower thresholds**

The digital triggering hardware in your PicoScope has two independent trigger thresholds called \textit{upper} and \textit{lower}. For some trigger types you can freely choose which threshold to use. The table in \texttt{ps2000aSetTriggerChannelDirections} shows which thresholds are available for use with which trigger types. Dual thresholds are used for pulse-width triggering, when one threshold applies to the level trigger and the other to the \textit{pulse-width qualifier}; and for window triggering, when the two thresholds define the upper and lower limits of the window.

Each threshold has its own trigger and hysteresis settings.

**Hysteresis**

Each trigger threshold (\textit{upper} and \textit{lower}) has an accompanying parameter called \textit{hysteresis}. This defines a second threshold at a small offset from the main threshold. The trigger fires when the signal crosses the trigger threshold, but will not fire again until the signal has crossed the hysteresis threshold and then returned to cross the trigger threshold. The double-threshold mechanism prevents noise on the signal from causing unwanted trigger events.

For a rising-edge trigger the hysteresis threshold is below the trigger threshold. After one trigger event, the signal must fall below the hysteresis threshold before the trigger is enabled for the next event. Conversely, for a falling-edge trigger, the hysteresis threshold is always above the trigger threshold. After a trigger event, the signal must rise above the hysteresis threshold before the trigger is enabled for the next event.

\begin{center}
\textbf{Hysteresis} – The trigger fires at \textbf{A} as the signal rises past the trigger threshold. It does not fire at \textbf{B} because the signal has not yet dipped below the hysteresis threshold. The trigger fires again at \textbf{C} after the signal has dipped below the hysteresis threshold and risen again past the trigger threshold.
\end{center}
<table>

3.60  ps2000aSetTriggerDelay() – set up post-trigger delay

```c
PICO_STATUS ps2000aSetTriggerDelay
(  
  int16_t handle,
  uint32_t delay
)
```

This function sets the post-trigger delay, which causes capture to start a defined time after the trigger event.

<table>
<thead>
<tr>
<th><strong>Applicability</strong></th>
<th>All modes (but delay is ignored in streaming mode)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code> delay, the time between the trigger occurring and the first sample. For example, if delay=100 then the scope would wait 100 sample periods before sampling. At a <code>timebase</code> of 1 GS/s, or 1 ns per sample, the total delay would then be 100 x 1 ns = 100 ns. PICO_USER_CALLBACK  
PICO_DRIVER_FUNCTION
3.61 ps2000aSetTriggerDigitalPortProperties() - set up digital channel trigger directions

```
PICO_STATUS ps2000aSetTriggerDigitalPortProperties
    (int16_t handle,
     PS2000A_DIGITAL_CHANNEL_DIRECTIONS* directions,
     int16_t nDirections)
```

This function will set the individual Digital channels trigger directions. Each trigger direction consists of a channel name and a direction. If the channel is not included in the array of `PS2000A_DIGITAL_CHANNEL_DIRECTIONS` the driver assumes the digital channel's trigger direction is `PS2000A_DIGITAL_DONT_CARE`.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
</table>
| Arguments     | handle, device identifier returned by `ps2000aOpenUnit`
|               | * directions, a pointer to an array of `PS2000A_DIGITAL_CHANNEL_DIRECTIONS` structures describing the requested properties. The array can contain a single element describing the properties of one channel, or a number of elements describing several digital channels. If `directions` is NULL, digital triggering is switched off. A digital channel that is not included in the array will be set to `PS2000A_DIGITAL_DONT_CARE`. |
|               | `nDirections`, the number of digital channel directions being passed to the driver |
| Returns       | `PICO_OK`
|               | `PICO_INVALID_HANDLE`
|               | `PICO_DRIVER_FUNCTION`
|               | `PICO_INVALID_DIGITAL_CHANNEL`
|               | `PICO_INVALID_DIGITAL_TRIGGER_DIRECTION` |
3.61.1 PS2000A_DIGITAL_CHANNEL_DIRECTIONS structure

A structure of this type is passed to \texttt{ps2000aSetTriggerDigitalPortProperties} in the \texttt{directions} argument to specify the trigger mechanism, and is defined as follows:

\begin{verbatim}
pragma pack(1)
typedef struct tPS2000ADigitalChannelDirections {
    PS2000A_DIGITAL_CHANNEL channel;
    PS2000A_DIGITAL_DIRECTION direction;
} PS2000A_DIGITAL_CHANNEL_DIRECTIONS;
#pragma pack()

typedef enum enPS2000ADigitalChannel {
    PS2000A_DIGITAL_CHANNEL_0,
    PS2000A_DIGITAL_CHANNEL_1,
    PS2000A_DIGITAL_CHANNEL_2,
    PS2000A_DIGITAL_CHANNEL_3,
    PS2000A_DIGITAL_CHANNEL_4,
    PS2000A_DIGITAL_CHANNEL_5,
    PS2000A_DIGITAL_CHANNEL_6,
    PS2000A_DIGITAL_CHANNEL_7,
    PS2000A_DIGITAL_CHANNEL_8,
    PS2000A_DIGITAL_CHANNEL_9,
    PS2000A_DIGITAL_CHANNEL_10,
    PS2000A_DIGITAL_CHANNEL_11,
    PS2000A_DIGITAL_CHANNEL_12,
    PS2000A_DIGITAL_CHANNEL_13,
    PS2000A_DIGITAL_CHANNEL_14,
    PS2000A_DIGITAL_CHANNEL_15,
    PS2000A_DIGITAL_CHANNEL_16,
    PS2000A_DIGITAL_CHANNEL_17,
    PS2000A_DIGITAL_CHANNEL_18,
    PS2000A_DIGITAL_CHANNEL_19,
    PS2000A_DIGITAL_CHANNEL_20,
    PS2000A_DIGITAL_CHANNEL_21,
    PS2000A_DIGITAL_CHANNEL_22,
    PS2000A_DIGITAL_CHANNEL_23,
    PS2000A_DIGITAL_CHANNEL_24,
    PS2000A_DIGITAL_CHANNEL_25,
    PS2000A_DIGITAL_CHANNEL_26,
    PS2000A_DIGITAL_CHANNEL_27,
    PS2000A_DIGITAL_CHANNEL_28,
    PS2000A_DIGITAL_CHANNEL_29,
    PS2000A_DIGITAL_CHANNEL_30,
    PS2000A_DIGITAL_CHANNEL_31,
    PS2000A_MAX_DIGITAL_CHANNELS
} PS2000A_DIGITAL_CHANNEL;

typedef enum enPS2000ADigitalDirection {
    PS2000A_DIGITAL_DONT_CARE,
}\end{verbatim}
PS2000A_DIGITAL_DIRECTION_LOW,
PS2000A_DIGITAL_DIRECTION_HIGH,
PS2000A_DIGITAL_DIRECTION_RISING,
PS2000A_DIGITAL_DIRECTION_FALLING,
PS2000A_DIGITAL_DIRECTION_RISING_OR_FALLING,
PS2000A_DIGITAL_MAX_DIRECTION
} PS2000A_DIGITAL_DIRECTION;

The structure is byte-aligned. In C++, for example, you should specify this using the #pragma pack() instruction.
### 3.62 ps2000aSigGenArbitraryMinMaxValues() – query AWG parameter limits

```c
PICO_STATUS ps2000aSigGenArbitraryMinMaxValues(
    int16_t handle,
    int16_t * minArbitraryWaveformValue,
    int16_t * maxArbitraryWaveformValue,
    uint32_t * minArbitraryWaveformSize,
    uint32_t * maxArbitraryWaveformSize
)
```

This function returns the range of possible sample values and waveform buffer sizes that can be supplied to `ps2000aSetSigGenArbitrary` for setting up the arbitrary waveform generator (AWG). These values may vary between models.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All models with AWG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td></td>
<td>minArbitraryWaveformValue, on exit, the lowest sample value allowed in the arbitraryWaveform buffer supplied to <code>ps2000aSetSigGenArbitrary</code></td>
</tr>
<tr>
<td></td>
<td>maxArbitraryWaveformValue, on exit, the highest sample value allowed in the arbitraryWaveform buffer supplied to <code>ps2000aSetSigGenArbitrary</code></td>
</tr>
<tr>
<td></td>
<td>minArbitraryWaveformSize, on exit, the minimum value allowed for the arbitraryWaveformSize argument supplied to <code>ps2000aSetSigGenArbitrary</code></td>
</tr>
<tr>
<td></td>
<td>maxArbitraryWaveformSize, on exit, the maximum value allowed for the arbitraryWaveformSize argument supplied to <code>ps2000aSetSigGenArbitrary</code></td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_NOT_SUPPORTED_BY_THIS_DEVICE, if the device does not have an arbitrary waveform generator</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER, if all the parameter pointers are NULL</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>
### 3.63 ps2000aSigGenFrequencyToPhase() – calculate AWG phase from frequency

**PICO_STATUS** ps2000aSigGenFrequencyToPhase(

```
  int16_t        handle,
  double         frequency,
  PS2000A_INDEX_MODE indexMode,
  uint32_t       bufferLength,
  uint32_t*      phase
```

)

This function converts a frequency to a phase count for use with the arbitrary waveform generator setup functions ps2000aSetSigGenArbitrary and ps2000aSetSigGenPropertiesArbitrary. The value returned depends on the length of the buffer, the index mode passed and the device model.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All models with AWG</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arguments</strong></td>
<td>handle, device identifier returned by ps2000aOpenUnit</td>
</tr>
<tr>
<td></td>
<td>frequency, the required AWG output frequency</td>
</tr>
<tr>
<td></td>
<td>indexMode, see ps2000aSetSigGenArbitrary</td>
</tr>
<tr>
<td></td>
<td>bufferLength, the number of samples in the AWG buffer</td>
</tr>
<tr>
<td></td>
<td>phase, on exit, the deltaPhase argument to be sent to the AWG setup function</td>
</tr>
<tr>
<td><strong>Returns</strong></td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_NOT_SUPPORTED_BY_THIS_DEVICE, if the device does not have an AWG</td>
</tr>
<tr>
<td></td>
<td>PICO_SIGGEN_FREQUENCY_OUT_OF_RANGE, if the frequency is out of range</td>
</tr>
<tr>
<td></td>
<td>PICO_NULL_PARAMETER, if phase is a NULL pointer</td>
</tr>
<tr>
<td></td>
<td>PICO_SIG_GEN_PARAM, if indexMode or bufferLength is out of range</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>

3.64 ps2000aSigGenSoftwareControl() – trigger the signal generator

```c
PICO_STATUS ps2000aSigGenSoftwareControl
(
    int16_t handle,
    int16_t state
)
```

This function causes a trigger event, or starts and stops gating. Use it as follows:

1. Call `ps2000aSetSigGenBuiltIn` or `ps2000aSetSigGenArbitrary` to set up the signal generator, setting the `triggerSource` argument to `SIGGEN_SOFT_TRIG`.

2. (a) If you set the signal generator `triggerType` to edge triggering (`PS2000A_SIGGEN_RISING` or `PS2000A_SIGGEN_FALLING`), call `ps2000aSigGenSoftwareControl` once to trigger a capture.
   (b) If you set the signal generator `triggerType` to gated triggering (`PS2000A_SIGGEN_GATE_HIGH` or `PS2000A_SIGGEN_GATE_LOW`), call `ps2000aSigGenSoftwareControl` with `state` set to 0 to start capture, and then again with `state` set to 1 to stop capture.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>Use with <code>ps2000aSetSigGenBuiltIn</code> or <code>ps2000aSetSigGenArbitrary</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td><code>handle</code>, device identifier returned by <code>ps2000aOpenUnit</code>&lt;br&gt;<code>state</code>, specifies whether to start or stop capture. Effective only when the signal generator <code>triggerType</code> is set to <code>SIGGEN_GATE_HIGH</code> or <code>SIGGEN_GATE_LOW</code>. Ignored for other trigger types.</td>
</tr>
<tr>
<td>Returns</td>
<td><code>PICO_OK</code>&lt;br&gt;<code>PICO_INVALID_HANDLE</code>&lt;br&gt;<code>PICO_NO_SIGNAL_GENERATOR</code>&lt;br&gt;<code>PICO_SIGGEN_TRIGGER_SOURCE</code>&lt;br&gt;<code>PICO_DRIVER_FUNCTION</code>&lt;br&gt;<code>PICO_NOT_RESPONDING</code></td>
</tr>
</tbody>
</table>
3.65  ps2000aStop() – stop data capture

```c
PICO_STATUS ps2000aStop
(
   int16_t    handle
)
```

This function stops the scope device while it is waiting for a trigger or capturing data.

- In block mode, you can optionally call `ps2000aStop` to terminate the current capture. Any data in the buffer will be invalid.
- In rapid block mode, you can optionally call `ps2000aStop` to terminate the sequence of captures. Any completed captures will contain valid data but no further captures will be made.
- In streaming mode, calling `ps2000aStop` is the usual way to terminate data capture. If this function is called before a trigger event occurs, the oscilloscope may not contain valid data. If capture has already started, the buffer will contain valid data.

<table>
<thead>
<tr>
<th>Applicability</th>
<th>All modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arguments</td>
<td>handle, device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td>Returns</td>
<td>PICO_OK</td>
</tr>
<tr>
<td></td>
<td>PICO_INVALID_HANDLE</td>
</tr>
<tr>
<td></td>
<td>PICO_USER_CALLBACK</td>
</tr>
<tr>
<td></td>
<td>PICO_DRIVER_FUNCTION</td>
</tr>
</tbody>
</table>
3.66 ps2000aStreamingReady() – find out if streaming-mode data ready

```c
typedef void (CALLBACK *ps2000aStreamingReady)(
    int16_t handle,
    int32_t noOfSamples,
    uint32_t startIndex,
    int16_t overflow,
    uint32_t triggerAt,
    int16_t triggered,
    int16_t autoStop,
    void * pParameter)
```

This callback function is part of your application. You register it with the driver using `ps2000aGetStreamingLatestValues`, and the driver calls it back when streaming-mode data is ready. You can then download the data using the `ps2000aGetValuesAsync` function.

The function should do nothing more than copy the data to another buffer within your application. To maintain the best application performance, the function should return as quickly as possible without attempting to process or display the data.

### Applicability
- Streaming mode only

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>device identifier returned by <code>ps2000aOpenUnit</code></td>
</tr>
<tr>
<td>noOfSamples</td>
<td>the number of samples to collect</td>
</tr>
<tr>
<td>startIndex</td>
<td>an index to the first valid sample in the buffer. This is the buffer that was previously passed to <code>ps2000aSetDataBuffer</code></td>
</tr>
<tr>
<td>overflow</td>
<td>returns a set of flags that indicate whether an overvoltage has occurred on any of the channels. It is a bit pattern with bit 0 denoting Channel A.</td>
</tr>
<tr>
<td>triggerAt</td>
<td>an index to the buffer indicating the location of the trigger point relative to <code>startIndex</code>. The trigger point is therefore at <code>startIndex + triggerAt</code>. This parameter is valid only when <code>triggered</code> is non-zero.</td>
</tr>
<tr>
<td>triggered</td>
<td>a flag indicating whether a trigger occurred. If non-zero, a trigger occurred at the location indicated by <code>triggerAt</code>.</td>
</tr>
<tr>
<td>autoStop</td>
<td>the flag that was set in the call to <code>ps2000aRunStreaming</code></td>
</tr>
<tr>
<td>* pParameter</td>
<td>a void pointer passed from <code>ps2000aGetStreamingLatestValues</code>. The callback function can write to this location to send any data, such as a status flag, back to the application.</td>
</tr>
</tbody>
</table>

### Returns
- nothing
3.67 Wrapper functions

The Software Development Kits (SDKs) for PicoScope devices contain wrapper dynamic link library (DLL) files in the lib subdirectory of your SDK installation for 32-bit and 64-bit systems. The wrapper functions provided by the wrapper DLLs are for use with programming languages such as MathWorks MATLAB, National Instruments LabVIEW and Microsoft Excel VBA that do not support features of the C programming language such as callback functions.

The source code contained in the Wrapper projects contains a description of the functions and the input and output parameters.

Below we explain the sequence of calls required to capture data in streaming mode using the wrapper API functions.

The ps2000aWrap.dll wrapper DLL has a callback function for streaming data collection that copies data from the driver buffer specified to a temporary application buffer of the same size. To do this it must be registered with the wrapper and the channel must be specified as being enabled. You should process the data in the temporary application buffer accordingly, for example by copying the data into a large array.

**Procedure:**
1. Open the oscilloscope using **ps2000aOpenUnit**.
   1a. Inform the wrapper of the number of channels on the device by calling **setChannelCount**.
2. Select channels, ranges and AC/DC coupling using **ps2000aSetChannel**.
   2a. Inform the wrapper which channels have been enabled by calling **setEnabledChannels**.
3. **[MSOs] only** Set the digital port using **ps2000aSetDigitalPort**.
   3a. **[MSOs] only** Inform the wrapper which digital ports have been enabled by calling **setEnabledDigitalPorts**.
4. Use the appropriate trigger setup functions. For programming languages that do not support structures, use the wrapper’s advanced trigger setup functions.
5. **[MSOs] only** Use the trigger setup function **ps2000aSetTriggerDigitalPortProperties** to set up the digital trigger if required.
6. Call **ps2000aSetDataBuffer** (or for aggregated data collection **ps2000aSetDataBuffers**) to tell the driver where your data buffer(s) is(are).
   6a. Register the data buffer(s) with the wrapper and set the application buffer(s) into which the data will be copied.
      
      For analog channels: Call **setAppAndDriverBuffers** (or **setMaxMinAppAndDriverBuffers** for aggregated data collection).

      **[MSOs Only]** For digital ports: Call **setAppAndDriverDigiBuffers** (or **setMaxMinAppAndDriverDigiBuffers** for aggregated data collection).
7. Start the oscilloscope running using **ps2000aRunStreaming**.
8. Loop and call **GetStreamingLatestValues** and **IsReady** to get data and flag when the wrapper is ready for data to be retrieved.
8a. Call the wrapper’s `AvailableData` function to obtain information on the number of samples collected and the start index in the buffer.

8b. Call the wrapper’s `IsTriggerReady` function for information on whether a trigger has occurred and the trigger index relative to the start index in the buffer.

9. Process data returned to your application data buffers.

10. Call `AutoStopped` if the `autoStop` parameter has been set to `TRUE` in the call to `ps2000aRunStreaming`.

11. Repeat steps 8 to 10 until `AutoStopped` returns true or you wish to stop data collection.

12. Call `ps2000aStop`, even if the `autoStop` parameter was set to `TRUE`.

13. To disconnect a device, call `ps2000aCloseUnit`.
4 Further information

4.1 Programming examples

Your SDK installation includes programming examples in a selection of languages and development environments. Please refer to the SDK for details.

4.2 Driver status codes

Every function in the ps2000a driver returns a driver status code from the list of PICO_STATUS values in PicoStatus.h, which is included in the inc folder of the Pico Technology SDK.

4.3 Enumerated types and constants

Enumerated types and constants are defined in ps2000aApi.h, which is included in the SDK under the inc folder. We recommend that you refer to these constants by name unless your programming language allows only numerical values.

4.4 Numeric data types

Here is a list of the numeric data types used in the PicoScope 2000 Series A API:

<table>
<thead>
<tr>
<th>Type</th>
<th>Bits</th>
<th>Signed or unsigned?</th>
</tr>
</thead>
<tbody>
<tr>

<td>64</td>
<td>signed</td>
</tr>
<tr>
<td>uint64_t</td>
<td>64</td>
<td>unsigned</td>
</tr>
</tbody>
</table>
5 Glossary

**AC/DC control.** Each channel can be set to either AC coupling or DC coupling. With DC coupling, the voltage displayed on the screen is equal to the true voltage of the signal. With AC coupling, any DC component of the signal is filtered out, leaving only the variations in the signal (the AC component).

**Aggregation.** This is the data-reduction method used by the PicoScope 2000 Series (A API) scopes. For each block of consecutive samples, the scope transmits only the minimum and maximum samples over the USB port to the PC. You can set the number of samples in each block, called the aggregation parameter, when you call `ps2000aRunStreaming` for real-time capture, and when you call `ps2000aGetStreamingLatestValues` to obtain post-processed data.

**Aliasing.** An effect that can cause digital oscilloscopes to display fast-moving waveforms incorrectly, by showing spurious low-frequency signals (“aliases”) that do not exist in the input. To avoid this problem, choose a sampling rate that is at least twice the highest frequency in the input signal.

**Analog bandwidth.** All oscilloscopes have an upper limit to the range of frequencies at which they can measure accurately. The analog bandwidth of an oscilloscope is defined as the frequency at which a displayed sine wave has half the power of the input sine wave (or, equivalently, about 71% of the amplitude).

**Block mode.** A sampling mode in which the computer prompts the oscilloscope to collect a block of data into its internal memory before stopping the oscilloscope and transferring the whole block into computer memory. This mode of operation is effective when the input signal being sampled contains high frequencies. Note: To avoid aliasing effects, the maximum input frequency must be less than half the sampling rate.

**Buffer size.** The size, in samples, of the oscilloscope buffer memory. The buffer memory is used by the oscilloscope to temporarily store data before transferring it to the PC.

**ETS.** Equivalent Time Sampling. ETS constructs a picture of a repetitive signal by accumulating information over many similar wave cycles. This means the oscilloscope can capture fast-repeating signals that have a higher frequency than the maximum sampling rate. Note: ETS cannot be used for one-shot or non-repetitive signals.

**External trigger.** This is the BNC socket marked EXT on the oscilloscope. It can be used to start a data collection run but cannot be used to record data.

**Maximum sampling rate.** A figure indicating the maximum number of samples the oscilloscope is capable of acquiring per second. Maximum sample rates are given in MS/s (megasamples per second) or GS/s (gigasamples per second). The higher the sampling capability of the oscilloscope, the more accurate the representation of the high frequencies in a fast signal.

**MSO (mixed-signal oscilloscope).** An oscilloscope that has both analog and digital inputs.

**Overvoltage.** Any input voltage to the oscilloscope must not exceed the overvoltage limit, measured with respect to ground, otherwise the oscilloscope may be permanently damaged.

**PC Oscilloscope.** A measuring instrument consisting of a Pico Technology scope device and the PicoScope software. It provides all the functions of a bench-top oscilloscope without the cost of a display, hard disk, network adapter and other components that your PC already has.

**PicoScope software.** This is a software product that accompanies all our oscilloscopes. It turns your PC into an oscilloscope, spectrum analyzer.
Signal generator. This is a feature of some oscilloscopes which allows a signal to be generated without an external input device being present. The signal generator output is the BNC socket marked *Awg* or *Gen* on the oscilloscope. If you connect a BNC cable between this and one of the channel inputs, you can send a signal into one of the channels. It can generate a sine, square, triangle or arbitrary wave of fixed or swept frequency.

Streaming mode. A sampling mode in which the oscilloscope samples data and returns it to the computer in an unbroken stream. This mode of operation is effective when the input signal being sampled contains only low frequencies.

Timebase. The timebase controls the time interval across the scope display. There are ten divisions across the screen and the timebase is specified in units of time per division, so the total time interval is ten times the timebase.

USB 1.1. An early version of the Universal Serial Bus standard found on older PCs. Although your PicoScope will work with a USB 1.1 port, it will operate much more slowly than with a USB 2.0 or 3.0 port.

USB 2.0. Universal Serial Bus (High Speed). A standard port used to connect external devices to PCs. The high-speed data connection provided by a USB 2.0 port enables your PicoScope to achieve its maximum performance.

USB 3.0. A faster version of the Universal Serial Bus standard. Your PicoScope is fully compatible with USB 3.0 ports and will operate with the same performance as on a USB 2.0 port.

Vertical resolution. A value, in bits, indicating the degree of precision with which the oscilloscope can turn input voltages into digital values. Calculation techniques can improve the effective resolution.

Voltage range. The voltage range is the difference between the maximum and minimum voltages that can be accurately captured by the oscilloscope.
