

# Audio Input

Receiver: Listens for repetitive audio Clicks. (like metronome) After a variable time period of 5-10 seconds if the clicks don't go away, the receiver will begin to output the audio clicks to an audio amplifier. The audio amplifier will begin to output the clicks at a much higher db level (+ 20db.) An LED will blink on and off in sync with the audio clicks. Every 5 seconds, the receiver will cease output and revert to listen mode.
